APPENDIX 2.5.4: Cumulative and Interval Summary Tabulation of Serious and Non-Serious Adverse Reactions From Post-Marketing Data Sources Organized per Patient with Relevant Co-Morbidities by Preferred Term per Country

Cumulative Reporting Period: Through 28-FEB-2021

Interval Reporting Period: 01-FEB-2021 Through 28-FEB-2021

Total Number of Cases: 4,953 (Interval) / 8,258 (Cumulative)

Total Number of Adverse Events (PT): 21,652 (Interval) / 36,395 (Cumulative)

MedDRA Version: v.23.1J

Country Where Event Occurred

APPENDIX 2.6: Cumulative and Interval Summary Tabulation of Serious and Non-Serious Adverse Reactions From Post-Marketing Sources Organized per MedDRA System Organ Class by High Level Term

Cumulative Reporting Period: Through 28-FEB-2021

Interval Reporting Period: 01-FEB-2021 Through 28-FEB-2021

Total Number of Cases: 23,558 (Interval) / 42,086 (Cumulative)

Total Number of Adverse Events (PT): 91,739 (Interval) / 158,648 (Cumulative)

MedDRA Version: v.23.1J

Appendix 3 (Referred in Section 9.2 Overview of Signals)

Tabular summary of safety topics and signals evaluated during the reporting interval

Product name: PF-07302048 (BNT162b2)

Reporting interval: 01 February 2021 – 28 February 2021

Eye swelling and Eye pain were signals that were closed (determined not to be risks) on 03 February 2021. Vomiting and Diarrhoea were signals that were closed (determined to be adverse reactions) on 10 February 2021. This is noted in the SMSR (01 Jan 2021 – 31 Jan 2021), therefore these events are not included in this table.

| Signal Term | Date Detected | Status (ongoing, or closed) | Date Closed (for closed signals) | Source or trigger of signal | Reason for evaluation and summary of key data | Method of signal evaluation | Action(s) taken or planned |
|---|---------------|-----------------------------|----------------------------------|--|--|---|---|
| Signals Determined not to be Risks | | | | | | | |
| Hearing Loss and Tinnitus | 08 Feb 2021 | Closed | 17 Feb 2021 | Post-authorization spontaneous reports and clinical safety data review. Note: Following internal review of hearing loss, the Jan 2021 SMSR EMA/PRAC final assessment requested review of hearing loss and tinnitus (Competent authority [EMA] request for assessment) | Cases of hearing loss were noted in clinical study C4591001 and in post-authorization reports. | Clinical study and safety database case series review Epidemiology observed vs expected analyses Note: Following receipt of PRAC Jan 2021 SMSR Final assessment report, Hearing loss was re-evaluated, and Tinnitus was evaluated | Following evaluation of reports and vaccine literature, it was determined that the available data did not support a causal association with vaccine. The topic will continue to be monitored. |

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Appendix 3.1 (Referred to in Section 9.2 Overview of Signals)

Summary of Safety Topics and Signal Evaluations

Table 1 presents signal evaluation summaries for PF-07302048 (BNT162b2) during the current reporting period.

Eye swelling and Eye pain were signals that were closed (determined not to be risks) on 03 February 2021 and Vomiting and Diarrhoea were signals that were closed (determined to be adverse reactions) on 10 February 2021. This is noted in the SMSR (01 Jan 2021 – 31 Jan 2021) and therefore they are not included in this table

Table 1. Summary of Signal Evaluations During the Reporting Interval

| Signal | Summary of Evaluation |
|--|---|
| Signals Determined not to be Risks | |
| Hearing loss and tinnitus | Hearing loss was evaluated in early Feb 2021 following reports received from participants in Study C4591001 and reported in the post-authorization safety database. Following evaluation and presentation to the internal joint safety management team, it was determined that the available data did not support a causal association with vaccine. Following this, the EMA PRAC final assessment report for the Jan 2021 SMSR was received and noted to contain a request to review hearing loss/deafness and tinnitus (see Appendix 3.3). A re-evaluation of hearing loss was conducted as was an evaluation of tinnitus. It was determined that there was no change in the previous conclusion on hearing loss and tinnitus was also determined not to be a causally associated risk of BNT162b2 use. This topic will continue to be monitored |
| Delayed syncope | Following a request for assessment of the topic by the US-FDA, Pfizer evaluated post-authorization reports of syncope and loss of consciousness occurring at least 1 day after vaccination. Reports were complicated by the presence of other factors such as hypersensitivity events, reactogenicity events and the presence of baseline medical conditions, including COVID-19, that were potentially contributory to the occurrence of syncope. It was determined that there was insufficient evidence to support a causal association of the specific event of delayed syncope to BNT162b2. This topic will continue to be monitored. |
| Immune Thrombocytopenia | The EMA PRAC final assessment report for the Jan 2021 SMSR contained a request to provide a safety evaluation of Immune thrombocytopenia. This evaluation is included in the Feb 2021 SMSR (See Appendix 3.2). The MAH has closely monitored reports of thrombocytopenia, including reviewing case series of post-authorization cases, non-clinical data, clinical data and epidemiological analyses (O/E). At this time, there is insufficient evidence to conclude that immune thrombocytopenia/thrombocytopenia is caused by BNT162b2. Close monitoring of this event continues. |
| Topics Determined not to be Validated Signals | |
| Myocarditis and Pericarditis | During a routine PV meeting with UK MHRA, the MHRA notified Pfizer of reports of pericarditis and myocarditis being reported to the national Yellow Card scheme. An evaluation of reports in the post-authorization safety database was conducted and the topic was determined not to be a validated signal. This topic will continue to be monitored. |
| Guillain-Barré syndrome | The EMA PRAC final assessment report for the Jan 2021 SMSR contained a request to provide a safety evaluation of Guillain-Barré syndrome. This evaluation is included in the Feb 2021 SMSR (See Appendix 3.6). The outcome of the |

| | |
|---|---|
| | evaluation of reports in the post-authorization safety database is that GBS was determined not to be a validated signal. This topic will continue to be monitored. |
| Severe Cutaneous Adverse Reactions (SCAR) | Reports of Erythema multiforme, Stevens Johnson syndrome and Toxic epidermal necrolysis were noted to be reported in the post-authorization spontaneous safety database and were thus evaluated. The outcome of the evaluation of reports in the post-authorization safety database is that SCAR was determined not to be a validated signal. This topic will continue to be monitored. |
| Ongoing Signals | |
| Tachycardia | Following review of the France Marseille PV Regional Centre PV report (17 Dec 2020 to 15 Jan 2021), in which 4 cases of serious tachycardia were noted as a potential risk, Pfizer has reviewed reports of tachycardia from the post-authorization safety database and the topic has been subsumed in an evaluation of vaccine stress-related responses that is currently ongoing |
| Dizziness | Dizziness has been noted as a frequently reported post-authorization AE in routine pharmacovigilance surveillance. Additionally, <ul style="list-style-type: none"> • In a routine PV meeting, MHRA noted cases of dizziness being reported to the national Yellow Card system, and • The EMA PRAC final assessment report for the Jan 2021 SMSR contained a request to provide a safety evaluation of Dizziness Pfizer has reviewed reports of dizziness from the post-authorization safety database and the evaluation is included in the Feb 2021 SMSR (See Appendix 3.5). The topic was subsequently subsumed in an evaluation of vaccine stress-related responses that is currently ongoing |
| Paraesthesia and Dysaesthesia | Following a query by the Israeli BOH regarding paraesthesia and a request by the PRAC to review paraesthesia and dysaesthesia, an evaluation of events reported in the clinical study and post-authorization setting was conducted on 10 Feb 2021. There was not evidence to support paraesthesia as a neurological causally associated reaction to the vaccine, however a further evaluation of paraesthesia has been subsumed in an evaluation of vaccine stress-related responses that is ongoing. |
| Vaccine stress-related responses | Based on post-authorization report and competent authority comments about events such as tachycardia, paraesthesia and dizziness, the topic of vaccine stress-related responses is ongoing. |
| Herpes zoster | This topic has been monitored in the clinical study (C4591001) and following authorization of the vaccine, cases have been reported to the post-authorization safety database. An evaluation of the signal is ongoing at this time and progress will be updated in the next SMSR. |
| Facial Paralysis | At the time of conditional approval in the EU, “Acute peripheral facial paralysis” was included as an adverse reaction in the EU SmPC at the request of the EMA. The MAH did not include this event in the CDS as a causally associated adverse reaction due to the lack of evidence for a causal association. Monitoring of the event has continued, and it has been determined by the internal joint safety management team, that causality assessment will be further informed by additional data from the remaining clinical study C4591001, which will be unblinded for final analysis approximately mid-April 2021. Additionally, non-interventional post-authorization safety studies C4591011 and C4591012 are expected to capture data on a sufficiently large vaccinated population to detect an increased risk of Bell’s palsy after vaccination through formal comparative analyses. The timeline for conducting these analyses will be established based on the size of the vaccinated population captured in the study data sources by the first interim reports (due 30 June 2021). Study C4591021, pending protocol endorsement by EMA, is also intended to inform this risk. |

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

APPENDIX 3.2 - SAFETY EVALUATION OF IMMUNE THROMBOCYTOPENIA

1. INTRODUCTION

This is an updated evaluation of the spontaneous cases of thrombocytopenia reported to the safety database for BNT/Pfizer COVID-19 vaccine, to be included in the February 2021 Summary Monthly Safety Report (SMSR).

2. METHODOLOGY

The Pfizer safety database was searched for spontaneously reported BNT/Pfizer COVID-19 vaccine post-authorization adverse event reports using MedDRA v 23.1 search strategy HLT Thrombocytopenias and SMQ Haematopoietic thrombocytopenia (narrow and broad) that have been reported to through 25 February 2021 (as of date 26 February 2021).

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

Cases were assessed using the Brighton Collaboration diagnostic criteria for thrombocytopenia.ⁱ The case definition of thrombocytopenia (TP) as an adverse event following immunization proposed by this working group is summarized below:

Level 1 of diagnostic certainty (confirmed TP):

Platelet count less than $150 \times 10^9 /L$

And confirmed by blood smear examination or the presence of clinical signs and symptoms of spontaneous bleeding.

Level 2 of diagnostic certainty (unconfirmed TP):

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Platelet count less than $150 \times 10^9/L$

Level 3 of diagnostic certainty:

Not applicable

3. RESULTS

Using this broad search strategy, 83 cases were retrieved from the safety database. This included the following number of events coded to relevant PTs: Thrombocytopenia (36 events), Immune thrombocytopenia (22 events), Thrombocytopenic purpura and Thrombotic thrombocytopenic purpura (2 events each), Pancytopenia and Platelet disorder (1 event each).

The 83 cases were individually reviewed to ensure focus on the safety event of interest. Eleven reports were eliminated from further review because they contained insufficient information to determine key factors including whether and when thrombocytopenia had occurred in relation to vaccination. A further 5 reports were eliminated because they were not relevant to the topic (1 case of hemoglobin decrease, not platelet decrease; 1 case did not meet BC case definition of thrombocytopenia; 3 cases described a patient inquiring about the appropriateness of vaccination for her husband with history of thrombocytopenia and relaying she heard about cases of thrombocytopenia and death post-vaccination).

The remaining 67 spontaneous reports of thrombocytopenia were reported between 21 Dec 2020 and 24 Feb 2021. They were all serious cases and included 38 women and 26 men between the ages of 21 and 97 years of age (mean 60.1). Country of case origin: US (25), UK (16), Germany and France (6 each), Belgium, Italy and Spain (2 each) and 1 each from Austria, Czech Republic, Ireland, Israel, Mexico, Portugal, Slovenia and Switzerland. There were 8 deaths.

3.1. Brighton Collaboration Criteria Level 1

There were 19 cases meeting criteria for BC Level 1 (platelet count of less than $150 \times 10^9 /L$ and signs or symptoms of bleeding). These cases included 2 patients with a medical history of thrombocytopenia or immune thrombocytopenia, one of which was diagnosed with COVID-19 at the time of their reported AE of thrombocytopenia.

Thirteen cases occurred following dose 1 of the vaccine, 2 followed dose 2 and 4 cases did not specify dose. The latency from vaccination to thrombocytopenia or evidence of bleeding ranged from 1 day following vaccination to 30 days; most cases (15) occurred within 12 days following vaccination. Reported platelet nadirs ranged from 0 to $114 \times 10^9/L$. Treatment was noted in 14 reports and included modalities such as IVIg, platelet transfusions and corticosteroids.

Outcome was provided in 15 cases: Recovered/Recovered with sequelae/Recovering (9), Fatal (3), Not recovered (3). The fatal cases were:

1. AER (b) (6) A 56-year-old male physician in the US with a medical history of hypertension (on no medications), social alcohol use and no history of COVID-19, received his first vaccination on 18 Dec 2020. On 21 Dec, he presented to the ED

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

with petechiae on his hands, feet and body. He had no other symptoms. He was found to have a platelet count of <1 . He was admitted and received treatment for 2 weeks including platelet transfusions, IVIG, steroids, rituximab and eltrombopag. His platelet count remained low and on 03 Jan, he was reported to have had an emergency splenectomy. On the same day, he had an intracranial bleed and a craniectomy but died. An autopsy was performed on 05 Jan however results were not provided.

2. AER (b) (6) An 82-year-old man in the UK with a medical history of cardiac bypass on an unspecified anticoagulant and gabapentin, presumably for back pain, received his first vaccination on 07 Jan 2021. He had epistaxis 28 days later and the following morning he collapsed and was found to have a platelet count of 0 and a cerebral haemorrhage. He died that day and it was not reported if an autopsy was performed.
3. AER (b) (6) An 88 year old frail woman in the UK with a medical history of aortic stenosis, atrial fibrillation, colon cancer, chronic renal disease, hip fracture and hypoparathyroidism, on anticoagulants among other medications was admitted to the hospital with symptoms related to an intracranial hemorrhage 30 days following vaccination; her platelet count was $12 \times 10^9/L$. A head CT confirmed the bleed. She was treated for immune thrombocytopenia and was reported to have a modest rise in platelets without extension of the bleeding, however she contracted pneumonia and died.

3.2. Brighton Collaboration Criteria Level 2

There were 32 cases meeting criteria for BC Level 2 (platelet count of less than $150 \times 10^9/L$). These cases included 11 patients with a medical history of thrombocytopenia or immune thrombocytopenia and 1 patient who was diagnosed with COVID-19 at the time of their reported AE of thrombocytopenia.

Twelve cases occurred following dose 1 of the vaccine, 5 followed dose 2 and 14 cases did not specify dose. An additional case (AER (b) (6)) was the only case of rechallenge in the total 67 reports.

- AER (b) (6) A 77 year old man in the US who was receiving unspecified treatment for a low platelet count prior to vaccination, received his first dose of vaccine on 09 Jan 2021 and with routine blood work at an unspecified time later noted that his platelet count had dropped “17 points.” Following his 2nd dose on 30 Jan 2021, blood work at an unspecified time after dose 2 showed that his platelet count had dropped even further (value not provided).

The latency from vaccination to thrombocytopenia or evidence of bleeding ranged from the same day of vaccination to 17 days; most cases (24) occurred within 12 days following vaccination. Reported platelet nadirs ranged from 0 to $138 \times 10^9/L$. Treatment was noted in 18 reports and included modalities such as platelet transfusions and corticosteroids.

Outcome was provided in 18 cases: Recovered/Recovering (8), Not recovered (6), Fatal (4). The fatal cases were:

1. AER (b) (6) 72-year-old man in France with a medical history of neurofibromatosis, kyphosis and chronic anxiety on multiple medications was brought to the hospital by his wife 9 days following vaccination for worsening of his general condition including cognitive and psychiatric states. Since the day after vaccination he had been having trouble breathing, fatigue, diffuse pain and asthenia that had limited his ability to go on walks. In the hospital, he was found to have thrombocytopenia (platelets 125 G/L), lymphopenia (0.8 G/L) and anemia (12.5 g/dl). The platelet nadir while in hospital was 73. Following an extensive workup, he was thought to have a rapidly progressive neurological disorder such as progressive Parkinson-like syndrome. After 1 week in the hospital he developed aspiration pneumonia; he died due to adult respiratory distress syndrome after 20 days in the hospital.
2. AER (b) (6) A 73-year-old man in Belgium with a history of end-stage renal disease (on hemodialysis), heart failure, atrial fibrillation, pneumonia and malnutrition received his 2nd vaccination on 06 Feb 2021. He developed a headache 30 minutes later then had decreased oxygen saturation and became comatose. In the hospital he had an elevated CRP, dimers, lactate and troponin (107 ng/l) and platelets of 61,000. He died that night; doctors did not think there was a causal relationship to the vaccine.
3. AER (b) (6) A 96-year-old woman in France with a medical history of osteoporosis, tetraparesis from cervical stenosis, severe kyphoscoliosis, hypothyroidism and supraventricular tachycardia on multiple medications received vaccination on 07 Jan 2021. The following day she was noted to have worsening cognitive function, falling out of bed, etc. Over the course of the next 10 days her oxygen requirements increased, and heart rate alternated between bradycardia and tachycardia (150 bpm) including atrial fibrillation. She was not febrile. Platelet count 8 days following vaccination was 96,000. Her other labs showed hyponatremia, hyperkalemia and elevated CRP. She died on 17 Jan 2021; an autopsy was not performed.
4. AER (b) (6) The wife of a man of unspecified age in the US reported that her husband died 2 weeks following vaccination of thrombocytopenia. His medical history and medications were not provided. She reported only the following: BP 159/106, bilirubin 1.50, osmolarity 297, urea 22.3, monocytes 12.1%, platelets 0. It was not known if an autopsy was performed.

3.3. Brighton Collaboration Criteria Level 3

There were 16 cases meeting criteria for BC Level 3. These cases included 1 patient with a medical history of immune thrombocytopenia.

Seven cases occurred following dose 1 of the vaccine, 2 followed dose 2 and 7 cases did not specify dose. When specified, latency from vaccination to thrombocytopenia or evidence of bleeding ranged from the same day as vaccination to 32 days following vaccination; half of the cases (8) occurred within 12 days following vaccination. Two cases specified platelet counts (5 and 70 x 10⁹/L). Treatment was noted in 5 reports.

Outcome was provided in 9 cases: Recovered/Recovering (4), Not recovered (4), Fatal (1).
 The fatal case was:

1. AER (b) (6) A consumer in the US reported that a patient of unspecified age and gender experienced thrombocytopenia, neutropenic fever and a pulmonary embolism at an unspecified date in relation to vaccination. Medical history and medications were not reported. The patient died on an unspecified date and it was not known if an autopsy was performed.

4. EPIDEMIOLOGY ANALYSIS

The MAH has conducted unadjusted observed to expected ratio (O/E) analyses for the 67 spontaneous reports of thrombocytopenia as of 26 February 2021. Expected case counts were derived using respective background incidence rates of 3.82/100,000 PYⁱⁱ.

An estimated 64,572,821.9 doses of Pfizer-BioNTech COVID 19 Vaccine were administered globally through 21 February 2021ⁱ. This estimate was derived from publicly available information reported by countries where Pfizer-BioNTech vaccine is authorized.ⁱⁱⁱ For periods when more than one vaccine was authorized for use in each country, the doses administered were assumed to be divided equally by the number of vaccines approved. This estimate does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios are reported with a 21-day risk window and without any risk window for the cumulative period with exposure through 21 February 2021. The O/E for both risk windows includes all cases in the numerator regardless of the duration between vaccination and the date of event onset.

Table 1. Observed to Expected Ratio of Spontaneously Reported Thrombocytopenia through 21 Feb 2021, Background Rate = 3.82/100,000PY^a

| | 21 Days (2,875,622 PY) | No risk window (4,396,086 PY) |
|-----------------------------|-----------------------------------|--|
| Observed cases ^b | 67 | 67 |
| Expected cases | 110 | 168 |
| O/E | 0.610 | 0.399 |
| (95% CI) | 0.473, 0.775 | 0.309, 0.507 |

a. Willame, 2020

b. Subsequent to review

The ratios of observed to expected cases do not exceed 1 over either risk window.

¹ Thrombocytopenia cases are reported through 26 February. Pfizer generates person years of exposure on weekly basis. Expected number of cases is based on 21 February 2021 to provide a conservative estimate for signal detection.

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

There are several limitations to observed to expected analyses for signal detection. The observed case counts are likely to be underestimated due to underreporting that occurs with spontaneous report surveillance. Additional reasons for underestimations include incomplete reporting and lags in reporting. Spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine are more likely to be reported even if they do not meet the clinical definition. Conversely, events that have not been previously associated with a vaccine are more likely to be underreported due to lack of recognition of a potential association.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Additionally, with multiple vaccines becoming available globally, the assumption that the vaccines are distributed in equal proportions may lead to over or underestimates.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. The population from which the background rates used in this analysis were derived may differ from the vaccinated population with respect to delivery of health care, population demographics, and underlying health status of the populations. To date, the majority of exposure derives from the US.

A final limitation concerns the risk windows, the time it is assumed that one is at risk for a given event if there is a causal association to the vaccine. Expected cases counts were determined under two assumptions: a 21 day window and an unlimited risk window. Observed to expected analyses were completed using the same number of observed cases compared to expected under both assumptions, regardless of proximity of the reported event to the date of vaccination. This may lead to an overestimation of the O/E ratio if the observed cases occurred outside of the 21-day risk period. On the other hand, the ratio may be underestimated using the unlimited risk window if the risk period is finite.

5. SUMMARY AND CONCLUSION

The safety database contains 67 spontaneous reports of thrombocytopenia following the Pfizer/BNT COVID-19 vaccine as of 26 Feb 2021. Due to the diversity of case details, for example, variable time to onset to thrombocytopenia or bleeding, variable patient age and co-morbidities, variable outcomes from recovered to fatal and occurrence at either dose 1 or dose 2, it seems unlikely that a similar mechanism for thrombocytopenia is at play in these cases. Further, thrombocytopenia occurring on the same day or within a few days of vaccination seem inconsistent with a vaccine-mediated immune mechanism of platelet destruction. Currently, there is insufficient data to confirm a causal association. This topic will be followed closely in the upcoming PSURs.

APPENDIX 3.3 – SAFETY EVALUATION OF HEARING LOSS AND TINNITUS

1. INTRODUCTION

This is an evaluation of cases of deafness, sudden hearing loss and tinnitus spontaneously reported to the Pfizer safety database for BNT/Pfizer COVID-19 vaccine; this evaluation will be included in the February 2021 Summary Monthly Safety Report (SMSR).

2. METHODOLOGY

The Pfizer safety database was searched for spontaneously reported BNT/Pfizer COVID-19 vaccine post-authorization adverse event reports using MedDRA v 23.1 search strategy SMQ Hearing impairment (**narrow**) that were reported through 25 February 2021 (as of date 26 February 2021).

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

3. RESULTS

Using this wide search strategy, 463 cases were retrieved from the safety database. This included the following number of events coded to relevant PTs: Deafness (57 events), Deafness bilateral (3 events), Deafness neurosensory (12 events), Deafness transitory (2 events), Deafness unilateral (22 events), Sudden hearing loss (17 events) and Tinnitus (290 events).

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

3.1. Hearing Loss

Cases coded with any PT containing the term “deafness” or with the PT Sudden hearing loss were individually reviewed to ensure focus on the safety event of interest. From a total of 109 cases, 15 were eliminated from further review:

- 2 cases did not describe hearing loss following vaccination,
- 9 cases contained evidence of a more likely explanation of hearing loss (5 cases described brief hearing loss in association with fainting/vasovagal event, 2 cases described the presence of an ear/external ear infection, 1 case described brief hearing loss associated with a diabetic coma, and 1 case described a HBV vaccination with a closer temporal association with the hearing loss than the COVID-19 vaccination), and
- 4 cases contained insufficient information to determine whether and when hearing loss had occurred in relation to vaccination.

The remaining 94 reports of deafness or sudden hearing loss were reported between 17 Dec 2020 and 19 Feb 2021. They were all serious cases and included 58 women and 34 men between the ages of 19 and 93 years of age (mean 56.3). Country of case origins were: US (40), UK (21), Germany (9), Netherlands (5), Italy (3), Spain, Poland, Greece and France (2 each), Belgium, Canada, Croatia, Czech Republic, Mexico, Portugal, Serbia and Sweden (1 each). There were no deaths.

Of the 94 reports, time from vaccination to onset of hearing loss was noted in 84:

- On the same day of vaccination (16); from 30 minutes to 6 hours,
- One day following vaccination (25),
- 2-3 days following vaccination (16),
- 4-7 days following vaccination (16),
- 9-14 days following vaccination (7),
- 16-21 days following vaccination (4).

Fifty-three (53) patients reported experiencing hearing loss after dose 1, 12 were reported following dose 2 and 29 reports did not specify dose. One report described a patient with hearing loss after dose 1 that worsened after dose 2 (AER (b) (6)). Tinnitus was co-reported with a minority of the cases (28/94, 29.8%).

Some of the patients (23) had medical histories potentially contributory to hearing loss. These histories included patients with:

- Previous hearing loss with or without tinnitus (5),
- Tinnitus alone (1),
- Acoustic neuroma (1),
- Meniere’s disease (1),
- Autoimmune disease (3),
- Diabetes mellitus (5),
- Migraine with vestibular symptoms (1),
- History of COVID-19 (5),
- Stroke (1).

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Outcome information showed 36 (38.3%) patients recovered, recovered with sequelae or were recovering; and 42 (44.7%) had not recovered at the time of reporting. Of the 36 patients who recovered or were recovering their hearing, ages ranged from 25 to 90 years (mean 54.8), 80.6% of the cases had a time to onset of less than 7 days and the duration of hearing loss, when provided, ranged from 10 minutes to 4 weeks; in the majority of cases (12/16, 75%), the duration was ≤ 7 days. Tinnitus was concurrent with 10 of the cases.

3.2. Tinnitus

There were 285 reports coded with the PT Tinnitus between 14 Dec 2020 and 23 Feb 2021. Of these 285 reports, 168 were serious and 117 were non-serious. The reports included 216 women and 65 men between the ages of 19 and 85 years of age (mean 50.8). Country of case origins were: US (108), UK (111), Italy (11), Mexico (8), Greece (7), France (5), Poland and Hungary (4 each), Finland, Spain, Denmark and Croatia (3 each), Canada and Germany (2 each) and singular cases from Sweden, Slovakia, Serbia, Romania, Portugal, Netherlands, Israel, Ireland, Czech Republic, Bulgaria and Austria. There were no deaths.

Focusing on the 168 serious reports containing the event Tinnitus, 2 of the reports were not relevant to the topic because they did not describe tinnitus. The remaining 166 reports included 129 women and 35 men between the ages of 22 and 85 years of age (mean 50.6). Latency from vaccination to tinnitus was provided in 133 reports and ranged from the same day (2 minutes after vaccination) to 30 days:

- Same day of vaccination (37)
- 1 day following vaccination (39)
- 2 days following vaccination (21)
- 3-6 days following vaccination (23)
- 7-9 days following vaccination (4)
- 10-20 days following vaccination (6)
- 21-30 days following vaccination (3)

When specified, 58 of the tinnitus events occurred after dose 1 and 16 occurred after dose 2. Two reports (AER (b) (6) and AER (b) (6)) described tinnitus after both dose 1 and dose 2. Duration of tinnitus was reported in 27 (16.3%) reports and ranged from 1 minute to “weeks”; 14 cases lasted from 1 to 9 days. Outcome for the 166 reports was as follows: 33 recovered/recovered with sequelae, 18 recovering, 81 not recovered and 34 outcomes were not known. Some patients had medical histories contributing to the possibility of experiencing tinnitus. Twenty-four (24) patients had medical histories of tinnitus and 5 described worsening of the tinnitus following vaccination. Seven (7) patients had medical histories of deafness, Meniere’s disease or mastoid disorders. Seven (7) patients had medical histories of COVID-19, one of these patients has also experienced tinnitus at the time of COVID-19. Two (2) patients were diagnosed with COVID-19 at the time they were having tinnitus. Three (3) of the patients had tinnitus associated with syncope occurring following vaccination.

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

4. EPIDEMIOLOGY ANALYSIS

The MAH has conducted unadjusted observed to expected ratio (O/E) analyses for the 168 serious tinnitus cases and the 94 reports of deafness or sudden hearing loss. Expected case counts were derived using respective background incidence rates of 54.0/100,000 PYⁱ and 27.0/100000 PYⁱⁱ.

An estimated 64,572,821.9 doses of Pfizer-BioNTech COVID 19 Vaccine were administered globally through 21 February 2021. This estimate was derived from publicly available information reported by countries where Pfizer-BioNTech vaccine is authorized. ⁱⁱⁱ For periods when more than one vaccine was authorized for use in each country, the doses administered were assumed to be divided equally by the number of vaccines approved. This estimate does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios are reported with a 21-day risk window and without any risk window for the cumulative period with exposure through 21 February 2021. The O/E for both risk windows included all cases in the numerator regardless of the duration between vaccination and the date of event onset.

Table 1. Observed to Expected Ratio of Spontaneously Reported Tinnitus through 21 Feb 2021, Background Rate = 54.0/100,000PY^a

| | 21 Days (2875621.9 PY) | No risk window (4396086.1 PY) |
|-----------------------------|---------------------------|----------------------------------|
| Observed cases ^b | 168 | 168 |
| Expected cases | 1552 | 2373 |
| O/E | 0.108 | 0.071 |
| (95% CI) | 0.092, 0.126 | 0.061, 0.082 |

a. [Martinez, 2015](#)

b. Subsequent to review

Table 2. Observed to Expected Ratio of Spontaneously Reported Hearing Loss through 21 Feb 2021, Background Rate = 27.0/100,000PY^a

| | 21 Days (2875621.9 PY) | No risk window (4396086.1 PY) |
|-----------------------------|---------------------------|----------------------------------|
| Observed cases ^b | 94 | 94 |
| Expected cases | 776 | 1187 |
| O/E | 0.121 | 0.079 |
| (95% CI) | 0.098, 0.148 | 0.064, 0.097 |

b. [Alexander, 2013](#)

b. Subsequent to review

The ratio of observed to expected cases does not exceed 1 over either risk window for either endpoint.

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

There are several limitations to observed to expected analyses for signal detection. The observed case counts are likely to be underestimated due to underreporting that occurs with spontaneous report surveillance. Additional reasons for underestimations include incomplete reporting and lags in reporting. Spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine are more likely to be reported even if they do not meet the clinical definition. Conversely, events that have not been previously associated with a vaccine are more likely to be underreported due to lack of recognition of a potential association.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Additionally, with multiple vaccines becoming available globally, the assumption that the vaccines are distributed in equal proportions may lead to over or underestimates.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. The population from which the background rates used in this analysis were derived may differ from the vaccinated population with respect to delivery of health care, population demographics, and underlying health status of the populations. To date, the majority of exposure derives from the US.

A final limitation concerns the risk windows, the time it is assumed that one is at risk for a given event if there is a causal association to the vaccine. Expected cases counts were determined under two assumptions: a 21-day window and an unlimited risk window. Observed to expected analyses were completed using the same number of observed cases compared to expected under both assumptions, regardless of proximity of the reported event to the date of vaccination. This may lead to an overestimation of the O/E ratio if the observed cases occurred outside of the 21-day risk period. On the other hand, the ratio may be underestimated using the unlimited risk window if the risk period is finite.

5. SUMMARY AND CONCLUSION

Hearing loss, including deafness and sudden hearing loss, have been spontaneously reported following vaccination with Pfizer/BNT B162b2 vaccine. Most reports are in adult and elderly patients, consistent with age populations targeted for vaccination in most regions. Most of the reports are in women, also consistent with the overall AE reporting profile. Most of the hearing loss reported occurs within one week after vaccination and has a duration of less than 1 week. There is one “rechallenge” report of a patient who experienced hearing loss following the first dose of vaccination which worsened after the second dose (AER (b) (6)). Outcomes have been variable, and follow-up is occurring.

At this time, statistical signal detection using EB05 >2 against a background of all other Pfizer products has not shown disproportionate reporting for events of hearing loss. Likewise, the observed to expected analyses for hearing loss does not indicate a signal.

Currently, there is insufficient data to conclude there is a causal association of hearing loss with the vaccine. This topic will be followed closely in the upcoming PSURs.

Tinnitus has also been reported in association with vaccination. Some reports are associated with hearing loss, but most are not. When reported in serious cases, tinnitus has mostly occurred soon after vaccination (within 1 week). Duration data is only available in a minority of cases; duration ranges from days to weeks. Two “rechallenge” reports describe tinnitus occurring after both dose 1 and dose 2 (AER (b) (6) and AER (b) (6)). Most of the events of tinnitus in the serious cases have not resolved at the time of reporting and follow-up is occurring. At this time there has been no statistical signal of disproportionate reporting for tinnitus in the Pfizer safety database, nor has it signaled in the observed to expected analyses. The review of this data does not suggest a causal association of tinnitus with the vaccine.

APPENDIX 3.4 SAFETY EVALUATION OF INSOMNIA

1. METHOD

The Pfizer safety database Argus was searched for all BNT162b2 vaccine spontaneous and literature reports and serious clinical trial reports received through 25th February 2021 using the following MedDRA version 23.1 search criteria: PT: Insomnia.

These PTs were also used to search adverse events in subjects reporting at least 1 adverse event from dose 1 to 1 month after dose 2 in the clinical trial Phase 2/3 safety population of ~38,000 participants (with a data cut-off date of 14 November 2020). This included a total of 18,801 subjects receiving BNT162b2 and 18,785 subjects receiving placebo.

2. RESULTS

Insomnia

Overall a total of 647 cases reporting PT insomnia were retrieved in the database. Among them 309 cases were assessed as non-serious and 338 as serious. A total of 462 (71.4%) subjects were female, 164 (25.3%) males and 21 (3.2%) subjects did not report the gender. Most reports are from US (280) followed by UK (231).

The age group was reported ranging from 0.8 to 90 years (reported for 579 cases, mean 50.6). Age distribution is reported below in Table 1.

Table 1. Age Breakdown of Subjects Reporting Insomnia

| Age range | Number of cases | Percentage (%) |
|-----------------------------------|-----------------|----------------|
| Less than or equal to 17 years | 1 | 0.2 % |
| 18 - 30 years | 73 | 11.3 % |
| 31 - 50 years | 235 | 36.3 % |
| 51 - 64 years | 135 | 20.9 % |
| 65 - 74 years | 65 | 10.0 % |
| Greater than or equal to 75 years | 71 | 11.0 % |
| Unknown | 67 | 10.4 % |

Most cases reported insomnia associated to reactogenicity events as pyrexia, vaccination site pain/pain, pain in extremity, headache, nausea as shown in Table 2.

Table 2. Most common co-reported PT with Insomnia

| Preferred term | Number of cases |
|----------------|-----------------|
| Pain | 276 |
| Headache | 254 |
| Pyrexia | 187 |
| Nausea | 149 |

Table 2. Most common co-reported PT with Insomnia

| Preferred term | Number of cases |
|-----------------------|------------------------|
| Vaccination site pain | 112 |
| Pain in extremity | 17 |

When reported, the most commonly reported time from the administration of vaccine to the onset of the event of insomnia, was as follows: within the same day in 218 cases, the next day in 152 cases, between 2-7 days in 67 cases and between 8-30 days in 22 cases.

Time to onset, when reported, was as follows: the same day in 221 cases, the day after in 153 subjects, between 2-7 days after vaccination in 68 cases and between 8-30 days in 23 cases.

The duration of Insomnia was reported in 74 cases and was as follows: within 1 day (29 cases), from 1-2 days (26), 3-5 days (11), from longer than 5 days to 7 days (3), and from almost 13 days to 20 days (3).

The outcome per the event of Insomnia was reported as recovered/recovering (for 253 events), recovered with sequelae (for 5 events), not recovered (for 131 events), and unknown (for 257 events).

Clinical Trial data

In the Phase 2/3 safety population, insomnia was reported in 23 subjects (0.1%) in the BNT162b2 group compared with 6 subjects (0.0%) in the placebo group.

3. CONCLUSION

A total of 647 spontaneous cases reported PT Insomnia cumulatively through 25th February 2021. Most cases reported time to the onset ranging from within the same vaccination day to the day after, and most of the cases reported associated reactogenicity events such as Pain, Headache, Pyrexia, Nausea, Vaccination site pain, and Pain in extremity which could contribute to difficulty to fall asleep. When reported (in 74 out of 647 cases), the most commonly reported duration of Insomnia was short in duration (from one to two days; 55 cases). Overall, given the totality of the available information, changes in the risk minimization measures or updates to the product information label are not warranted at this time.

APPENDIX 3.5 - SAFETY EVALUATION OF DIZZINESS

1. METHOD

The Pfizer safety database was searched for all BNT162b2 vaccine reports of dizziness received through 26 February 2021 using the following MedDRA version 23.1 search criteria: PT: Dizziness.

PT Dizziness was also searched in Clinical study C4591001 subjects reporting at least 1 adverse event from dose 1 to 1 month after dose 2 in the clinical trial Phase 2/3 safety population of ~38,000 participants (with a data cut-off date of 14 November 2020). This included a total of 18,801 subjects receiving BNT162b2 and 18,785 subjects receiving placebo.

2. RESULTS

2.1. Safety Database

A total of 4637 cases were retrieved using the criteria mentioned above. There were 3751 females (80.9%), 762 males (16.4%) and gender was not reported for 124 cases (2.7%). A total of 2486 cases containing the PT Dizziness were assessed as serious and 2151 as non-serious. A total of 4579 cases were spontaneous, and one was a solicited report. Fifty-seven reports were from clinical studies and were blinded so they are not further considered in this evaluation. One case was a solicited report.

Age ranged between 0.1 to 107 years (mean of 48 years, N = 4248), age stratification is reported in Table 1.

Table 1. Age Stratification

| Age stratification | Number of cases | Percentage (%) |
|-----------------------------------|-----------------|----------------|
| Less than or equal to 17 years | 13 | 0.3 % |
| 18 - 30 years | 721 | 15.5 % |
| 31 - 50 years | 1847 | 39.8 % |
| 51 - 64 years | 864 | 18.6 % |
| 65 - 74 years | 412 | 8.9 % |
| Greater than or equal to 75 years | 404 | 8.7 % |
| Unknown | 376 | 8.1 % |

Most cases were reported from UK (1571) follow by US (1471). The list of the top 10 reporting countries are listed in [Table 2](#).

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Table 2. Top 10 Reporting Countries

| Countries | Number of cases | Percentage (%) |
|----------------|-----------------|----------------|
| UNITED KINGDOM | 1571 | 33.9 % |
| UNITED STATES | 1471 | 31.7 % |
| MEXICO | 441 | 9.5 % |
| GERMANY | 210 | 4.5 % |
| ITALY | 128 | 2.8 % |
| DENMARK | 115 | 2.5 % |
| SPAIN | 70 | 1.5 % |
| GREECE | 61 | 1.3 % |
| PORTUGAL | 59 | 1.3 % |
| SWEDEN | 53 | 1.1 % |

Time to onset, when provided, was reported as the same day for 1809 cases, the day after vaccination for 1334 subjects, day 2-7 days after vaccination in 601 cases and from 8-14 days after vaccination in 78 cases.

Many cases were associated with reactogenicity events such as nausea, vomiting, pyrexia, pain, headache and with events such as tachycardia, hypotension and anxiety. PTs most commonly co-reported with dizziness are in Table 3. A total of 201 cases out of 4637 reported dizziness as the only adverse event in the case.

Table 3. Most Commonly Co-Reported PTs

| PT | Number of Cases |
|--|-----------------|
| Headache | 1793 |
| Pain, Vaccination site pain, Pain in extremity | 1790 |
| Nausea, Vomiting | 1658 |
| Pyrexia, Chills | 1343 |
| Tachycardia, Palpitations | 548 |
| Dyspnoea | 496 |
| Syncope, Presyncope, Loss of consciousness | 415 |
| Hypotension, Blood pressure decrease | 141 |
| Allergy, Anaphylaxis | 128 |
| Anxiety, Fear | 96 |
| Dizziness is the only PT reported in case | 201 |

Outcome at case level was reported as follows: resolved/resolving/resolved with sequel for 2447 subjects, not recovered at time of reporting for 1425 cases, fatal for 8 patients and unknown for 757 cases. The 8 cases reporting a fatal outcome are presented in Table 4 and none was directly due to the event dizziness.

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Table 4. Fatal Reports

| AER Number | Age (years) | Gender | Medical History | Conmed | Events Reported | Country |
|------------|-------------|--------|--|---|--|----------------|
| (b) (6) | | MALE | Asthma / Vitamin D deficiency | COLECALCIFEROL / SALBUTAMOL SULFATE | Death, Epistaxis, Headache, Dizziness, Haemoptysis, Haematemesis | UNITED KINGDOM |
| (b) (6) | 27.00 | MALE | | | Haematemesis, Loss of consciousness, Dizziness, Pyrexia. The events presented 2 days after vaccination. No additional information were available | UNITED KINGDOM |

| (b) (6) | 80.00 | MALE | Arteriosclerosis / Atrial fibrillation / Chronic obstructive pulmonary disease / Renal disorder | | Arteriosclerosis, Cardiovascular disorder, Dizziness, Nausea, Headache | UNITED STATES |
| (b) (6) | 91.00 | MALE | Atrial fibrillation / Cardiac failure chronic / Chronic respiratory failure / Deep vein thrombosis / Dependence on oxygen therapy / Fall / Hypertension / Implantable | APIXABAN / BUMETANIDE / MORPHINE / TRAMADOL | Cardiac failure, Hallucination, Oedema peripheral, Confusional state, Dizziness | NORWAY |

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Table 4. Fatal Reports

| AER Number | Age (years) | Gender | Medical History | Conmed | Events Reported | Country |
|------------|-------------|--------|---|--|---|---------|
| | | | defibrillator insertion / Intermittent claudication / Living in residential institution / Non-tobacco user / Pleural effusion / Polymyalgia rheumatica / Prostate cancer / Walking aid user | | | |
| (b) (6) | 95.00 | FEMALE | Cardiac failure / Dementia / Living in residential institution / Multimorbidity / Treatment noncompliance | | Syncope, General physical health deterioration, Dyspnoea, Muscular weakness, Dizziness, Bedridden, Apnoea | NORWAY |
| (b) (6) | 66.00 | FEMALE | Coeliac disease / Crohn's disease | ALENDRONIC ACID / BUDESONIDE / CALCIUM CARBONATE | Death, Restless legs syndrome, Dizziness, Dyspnoea | SWEDEN |
| (b) (6) | 94.00 | MALE | Dementia Alzheimer's type / Osteoporosis / Prostatic adenoma / Prostatitis | | Death, Chest discomfort, Vomiting, Vertigo, Dizziness, Neuralgia, Fall | FRANCE |

Among the cases reporting only dizziness as symptom, age ranged between 18 to 90 years (mean: 53.8 years, median: 53 years, N: 171), were mostly females (136 Females, 54 Males and 11 of unknown gender). Medical history was reported for 66 out of 201 cases and blood pressure abnormal/hypertension was reported for 20 cases, 11 reported asthma, previous Covid-19 diseases was reported in 7 patients, anxiety/mental disorder/depression and diabetes/glucose intolerance in 4 patients each. None of these cases reported a fatal outcome.

Duration of the event dizziness was reported by 761 cases and it ranges from minutes to 20 days as shown in [Table 5](#).

Table 5. Duration of Dizziness

| Duration of the event Dizziness | Number of cases |
|--|------------------------|
| Minutes to 2 hours | 118 |
| Between 2 to 24 hours | 396 |
| Between 2-10 days | 124 |
| Between 11-20 days | 123 |
| Total: | 761 |

2.2. Clinical Trial Data

Only unblinded cases will be discussed in this report. In the Phase 2/3 safety population, insomnia was reported in 56 subjects (0.3%) in the BNT162b2 group compared with 48 subjects (0.3%) in the placebo group. No differences in frequency of dizziness reports occurred in participants vaccinated with BNT162b2 and participants receiving placebo.

3. CONCLUSION

Overall, 4637 cases of dizziness were retrieved in the Pfizer safety database. Most cases of dizziness were reported in the context of reactogenicity events or events consistent with stress or anxiety. The majority of cases reported dizziness occurring within minutes of vaccination or the same day and with a limited duration. Considering this presentation of the event and the clinical data which does not support dizziness as a reaction to the vaccine itself, dizziness appears to be most consistent with an immunization stress related reaction rather than a unique vaccine adverse reaction. It will be considered within the review of vaccine stress-related responses that is ongoing and no change to the CDS is warranted at this time, prior to the completion of the vaccine stress-related responses review.

1. INTRODUCTION

Guillain–Barré syndrome (GBS) is currently the most frequent cause of acute flaccid paralysis in developed countries and constitutes one of the serious emergencies in neurology.^{1,2} GBS is an acute inflammatory polyneuropathy, characterized by a rapidly progressive, symmetric, ascending flaccid paresis, weakness, with areflexia and albuminocytologic dissociation (ie, high levels of protein in the cerebrospinal fluid and normal cell counts). Based on clinical features, etiology, pathologic and electrophysiological studies, GBS may be sub classified into several forms. These are: acute inflammatory demyelinating polyradiculoneuropathy; axonal forms of GBS, which include acute motor-sensory axonal neuropathy and acute motor axonal neuropathy; and Miller Fisher syndrome (MFS).³ MFS syndrome is characterized by ophthalmoplegia, ataxia, areflexia and albuminocytologic dissociation.^{1,2} The diagnosis is made through clinical findings, cerebrospinal fluid analysis (CSF) and nerve conduction studies. Treatment involves the administration of intravenous immunoglobulins, plasma exchange, continuous monitoring and supportive care.² Though the syndrome is rare, early diagnosis and treatment can significantly improve outcomes and avoid the need for ventilatory support.¹

Although the underlying etiology and pathophysiology of GBS are not completely understood, it is considered to be a post-infectious autoimmune disease. Auto-antibodies develop in response to variety bacterial or viral antigens that cross react with epitopes on peripheral nerves, leading to demyelination, axonal damage or both.^{4,5} About Two thirds of cases are preceded by symptoms of upper respiratory tract infection or diarrhea within the previous 6 weeks from symptoms onset.^{2,6} The interval between the prodromal infection and the onset of GBS symptoms varies between 1 week and 3 weeks (averaged 11 days), occasionally longer.⁷ *Campylobacter jejuni* (*C. jejuni*) is the most frequent antecedent infection. A recent meta-analysis showed that 30% of GBS cases are attributable to *C. jejuni* infection.⁸ Cytomegalovirus has been found as second common antecedent infection which was identified in up to 13% of cases.⁹ The incidence of GBS following *C. jejuni* infection and primary CMV infection were estimated to be between 0.25 -0.65 and 0.6 - 2.2 cases per 1000 cases.¹⁰ Other infectious agents related to GBS are Epstein–Barr virus, varicella–zoster virus, and *Mycoplasma pneumoniae*.⁹

The overall incidence of GBS ranges from 0.81 to 1.89 (median 1.11) cases per 100,000 person-years. GBS incidence increases by 20% for every 10-year increase in age. The age-specific GBS rate increased from 0.62 cases per 100,000 person-years among 0 to 9 years old to 2.66 cases per 100,000 person-years among 80 to 89 years old population. Some studies showed a slight peak in late adolescence and young adulthood, coinciding with an increased risk of infections with cytomegalovirus and *C. jejuni*, and a second peak in the elderly.^{7,11} Males are more commonly affected (relative risk 1.78) than females.⁴

GBS is associated with increased hospitalization rate, length of hospital stay and mortality rate among older population. The overall case-fatality ratio of GBS ranges from 4.4% to 10%. The case-fatality ratio ranged from 0.7% among persons <15 years old to 8.6% among persons >65 years old. Overall, 12% of patients required hospitalization and intensive care unit treatment.^{1,12} Follow up after one year reported that 62% of the patients had complete functional recovery with no or minimal residual symptoms, whereas, remaining 38% patients

had made a poor functional recovery, 18% being unable to run, 9% being unable to walk unaided, 4% being bedbound or ventilated.¹³

2. GUILLAIN-BARRÉ SYNDROME AND VACCINATION

Several case reports and small case series have raised the concern about linkage of GBS to vaccinations on the grounds of a mere temporal association, but no secure causal relationship has been established until now.^{7,14} The estimated attributable risk of vaccine-related GBS in the adult population is one case per 100,000 vaccinations.¹⁵ Among the vaccines, evidence for causal relationship between vaccination and GBS have been published for influenza vaccine used in swine flu immunization campaign in 1976 and rabies vaccines prepared from either suckling mouse brain or mature sheep brain (Semple vaccine).^{16,17}

However, the results of studies investigating association between influenza vaccination and GBS following influenza immunization campaign in 1976 are conflicting. No temporally related increase in Guillain-Barré syndrome was found in members of the US Army who received the A/New Jersey (swine) influenza vaccine in 1976–1977.¹⁸ Another study found a non-significant increase in the risk of vaccine-associated Guillain–Barré syndrome in 1992–1993 and 1993–1994 influenza seasons.¹⁹

Other studies showed an increase risk of GBS among vaccinees who received influenza vaccines. Following suspension of National Influenza Immunization Program with A/New Jersey influenza vaccine in 1976, nationwide surveillance for GBS found significantly elevated attack rate in adult vaccinated population. The study also showed that the period of increased risk was concentrated primarily within the 5-week period after vaccination, although it lasted for approximately 9 or 10 weeks.¹⁵ Some years later, Vaccine Adverse Event Reporting System data from 1991 through 1999 showed an increased risk of acute GBS and severe GBS in comparison to an adult tetanus-diphtheria vaccine control group, although in 2002-2003, a 4-fold reduction in the annual reporting rate of GBS from 0.17 to 0.04 per 100, 000 vaccinees was observed compared to 1993-1994.²⁰

Since then, many articles have been published reporting small increased risk of GBS after influenza vaccination or following receipt of monovalent inactivated (H1N1), but also a number of studies reported that the relative and attributable risks of Guillain-Barré syndrome after seasonal influenza vaccination are lower than those after influenza illness.²¹⁻²³

3. GULLAIN-BARRÉ SYNDROME AND COVID-19

There is growing evidence that COVID-19 can also affect the nervous system. There are essentially two principal routes for viruses to gain entry into the central nervous system (CNS): hematogenous or neuronal retrograde dissemination.²⁴⁻²⁶ In hematogenous entry, a virus can infect endothelial cells of the blood brain barrier to gain access or infect leukocytes for dissemination into the CNS.²⁴⁻²⁶ As a second major route of entry to the CNS, some viruses infect neurons in the periphery and use the axonal transport machinery to enter the CNS.²⁴⁻²⁷ This could represent another potential route of entry to the CNS for SARS-CoV-2, that is via the cranial nerve. Moreover, the olfactory nerve serves as a shortcut for many viruses into the CNS.²⁸

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Examples of COVID-19 CNS disease include encephalopathy, encephalitis, acute disseminated encephalomyelitis, meningitis, ischemic and hemorrhagic stroke, venous sinus thrombosis and endothelialitis. In the peripheral nervous system COVID-19 is associated with dysfunction of smell and taste, muscle injury, the Guillain-Barre syndrome and its variants.²⁹

A number of case reports describing GBS in temporal association with COVID-19 infection have been reported.³⁰⁻³⁷ A subsequent systematic review from Abu-Rumeileh et al³⁸ analyzed the literature published on GBS until July 2020 and the analysis included 73 patients reported in 52 publications. They concluded that a broad age range was affected (mean 55, min 11–max 94 years) with male predominance (68.5%). Most patients showed respiratory and/or systemic symptoms, and developed GBS manifestations after COVID-19. However, asymptomatic cases for COVID-19 were also described. The distributions of clinical variants and electrophysiological subtypes resemble those of classic GBS, with a higher prevalence of the classic sensorimotor form and the acute inflammatory demyelinating polyneuropathy, although rare variants like MFS were also reported. The duration from onset of viral illness to neurologic manifestations have ranged from 3 to 33 days. CSF albumin cytological dissociation was present in about 71% cases, and CSF SARS-CoV-2 RNA was absent in all tested cases. More than 70% of patients showed a good prognosis, mostly after treatment with intravenous immunoglobulin. Patients with less favorable outcome were associated with a significantly older age in accordance with previous findings regarding both classic GBS and COVID-19. COVID-19-associated GBS seems to share most features of classic post-infectious GBS and possibly the same immune-mediated pathogenetic mechanisms.

In a pooled global analysis of three studies, Guillain-Barre syndrome was reported as a complication in 0.2% (0.2% to 0.9% range; 8/4,299) of PCR-confirmed COVID-positive hospitalized cases.³⁹⁻⁴¹

In conclusion, a causal association between GBS and COVID-19 remains speculative. Nevertheless, given that GBS has been already described as postinfectious complications of other coronavirus (Middle East respiratory syndrome) sharing similarities with SARS-CoV-2, the occurrence of GBS needs to be closely monitored and evaluated during the pandemic.⁴²

4. METHODOLOGY

The clinical trial database related to study C4591001 (COVID-19 vaccine study) was searched for cases of anaphylaxis using the following Standardized MedDRA Query: “Guillain-Barré Syndrome”, narrow search.

Cases will be adjudicated according to Brighton Collaboration (BC)⁴³ case definition and level of diagnostic certainty.

BC levels 1-3 of diagnostic certainty are defined as GBS or MFS with a different level of diagnostic certainty. Level 1 provides the highest level of diagnostic certainty, whereas the diagnostic certainty is lowest for level 3. Level 4 is defined as “reported event of GBS or FS, with insufficient evidence to meet the case definition” and level 5 as not a case of GBS or FS”.⁴³ Brighton collaboration details are reported below:

Level 1 of diagnostic certainty

- Bilateral AND flaccid weakness of the limbs
- AND
- Decreased or absent deep tendon reflexes in weak limbs
- AND
- Monophasic illness pattern AND interval between onset and nadir of weakness between 12 h and 28 days AND subsequent clinical plateau
- AND
- Electrophysiologic findings consistent with GBS
- AND
- Cytoalbuminologic dissociation (ie, elevation of CSF protein level above laboratory normal value AND CSF total white cell count <50 cells/ μ L)
- AND
- Absence of an identified alternative diagnosis for weakness
 -

Level 2 of diagnostic certainty

- Bilateral AND flaccid weakness of the limbs
- AND
- Decreased or absent deep tendon reflexes in weak limbs
- AND
- Monophasic illness pattern AND interval between onset and nadir of weakness between 12 h and 28 days AND subsequent clinical plateau
- AND
- CSF total white cell count <50 cells/ μ L (with or without CSF protein elevation above laboratory normal value)
- OR
- IF CSF not collected or results not available, electrophysiologic studies consistent with GBS
- AND
- Absence of identified alternative diagnosis for weakness
 -

Level 3 of diagnostic certainty

- Bilateral AND flaccid weakness of the limbs
- AND
- Decreased or absent deep tendon reflexes in weak limbs
- AND
- Monophasic illness pattern AND interval between onset and nadir of weakness between 12 h and 28 days AND subsequent clinical plateau
- AND
- Absence of identified alternative diagnosis for weakness

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

5. RESULTS

A total of 32 cases were identified using the search criteria described above. There were 22 female, 8 males and in 2 cases gender was not reported. The age range between 18 to 88 years of age (50.6 mean) aside of an additional case of 1-month of age. The age distribution was as follows: 20 (62.5%) adults (age ≥ 18 to < 65), 5 (15.6%) elderly (age ≥ 65), and for 6 (18.7%) cases the age was not reported, in addition a patient was reported as 1-month old. Most of the cases were reported from US (13, 40.6%), United Kingdom (5, 15.6%) followed by Mexico, Israel, Germany, Greece (2, 9.5% each), Italy, Chile, Sweden, Spain and Cyprus (1 each). The outcome of the event was reported as not recovered at time of reporting in 11 cases (34.4%), as recovering/resolving in 6 cases (18.7%), and as unknown in 14 cases (43.7%). One case had a fatal outcome (summary reported below).

All cases have been assessed according to BC criteria as follows:

- 1 case (3.1%) met level 1
- 2 cases (6.3%) met level 2
- 26 cases (81.3%) met level 4
- 3 cases (9.4%) met level 5

Two cases reported a medical history of polyneuropathy (chronic inflammatory demyelinating polyradiculoneuropathy/Peripheral sensory neuropathy). All other cases did not report a medical history of auto-immune diseases/previous GBS/other polyneuropathy or provided a medical history of recent infections. In 18 cases (56.2%), time to onset was reported ranging between 2 to 20 days post vaccination, in 4 cases (12.5%) it was reported as the same vaccination day or the day after and in 10 cases (31.2%) time to onset was not reported. The duration of the event was unknown or not reported in 27 cases (84.3%), in 2 cases (6.25%) it was reported as 1-2 days and in 3 cases (9.4%) it was reported as 11 or more days.

Case meeting BC Level 1

AER# (b) (6) : this case refers to a 49-year-old female patient that 4 days after vaccination experienced symptoms initially of sensory disturbances followed by motor disturbances. The diagnosis was confirmed by cyto-albuminologic dissociation and electroneurography with findings consistent with a demyelinating sensorimotor polyneuropathy. The medical history was not provided with respect to recent infections (respiratory and/or gastrointestinal) or previous auto-immune disorders. Outcome was reported as not yet recovered at time of reporting.

Cases meeting BC Level 2

AER# (b) (6) : this case refers to a 52-year-old male patient that 18 days after vaccine administration experienced acute paresthesia in the limbs. Symptoms worsened over the next

days (greater intensity of paresthesia, tactile hypoesthesia, walk instability and global areflexia). A neurophysiological study confirmed that those alterations were compatible with a sensitive-motor polyradiculoneuropathy of the demyelinating type. The patient did not have a medical history of previous polyneuropathies or recent infections.

AER# (b) (6) : this case refers to a 65-year-old male patient that 2 days after vaccination experienced bilateral lower extremity weakness, pain and paresthesia in bilateral hands and legs. Symptoms worsened in the next couple of weeks. The neurological exam showed areflexia throughout. All findings were consistent with acute inflammatory demyelinating polyneuropathy (AIDP or Guillain Barre Syndrome). The diagnosis was confirmed by cyto-albuminologic dissociation.

Case (AER# (b) (6)) reporting a fatal outcome:

The case reporting the fatal outcome met level 4 of BC and refers to an 81-year-old patient with a reported time to onset of 54 days. No medical history was reported for the patient. The reported event referred to a worsening in the weakness in both legs, without any further detail regarding his medical history and the pre-existing weakness in the limb (reported as worsening). The patient's health conditions deteriorated in couple of days (numbness in abdomen, progressive breathing problems) until he was admitted to the hospital and died. Overall, the information available at this time are not sufficient to perform an assessment of the causal relationship with the vaccine.

6. OBSERVED ANALYSIS OF BLINDED CLINICAL TRIAL DATA

We conducted unadjusted observed to expected ratio (O/E) analyses for the 32 Guillain-Barre cases reported. Expected case counts were derived using a background incidence rate of 2.06/100 000 PY from a meta-analysis of EU health records.⁴⁴

An estimated 75,397,549 doses of Pfizer-BioNTech COVID 19 Vaccine were administered globally through 28 February 2021. This estimate was derived from publicly available information reported by countries where Pfizer-BioNTech vaccine is authorized.⁴⁵ For periods when more than one vaccine was authorized for use in each country, the doses administered were assumed to be divided equally by the number of vaccines approved. This estimate does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios are reported assuming a 21-day risk window and without any risk window for the cumulative period through 28 February 2021. The O/E for both risk windows included all 32 cases in the numerator regardless of the duration between vaccination and the date of event onset.

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

Table 1. Observed to Expected Ratio of Spontaneously Reported Guillain-Barre through 28 Feb 2021

| Cumulative (N=32) | | |
|------------------------------|---------------------------|----------------------------------|
| Background rate | Risk Period | |
| | 21 Days (3,489,001 PY) | No risk window (5,777,558 PY) |
| 2.06/100,000 PY ^a | | |
| Expected cases | 71.9 | 119 |
| O/E | 0.45 | 0.27 |
| (95% CI) | 0.305, 0.629 | 0.184, 0.380 |

a. Willame, et al 2021⁴⁴

The ratio of observed to expected cases does not exceed 1 over either risk window.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine are more likely to be reported and potentially reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, the population from which the background rates used in this analysis were derived may differ from the vaccinated population with respect to delivery of health care, population demographics, and underlying health status of the populations. However, to date, the majority of exposure derives from the US.

A final limitation concerns the time at risk for a given event during which an excess of risk occurs in the case of causal association. 21 days and no risk window were selected to provide a range of evaluation for the number of expected cases, however, observed cases were included regardless of proximity to vaccination which may lead to overestimate if the observed cases occurred outside of the 21-day risk period.

7. CONCLUSION

In summary the majority of the cases reported (26, 81.3%) met level 4 of BC and among them, 3 cases reported a time to onset that, even though plausible does not have a biological plausibility to trigger the reported demyelination (range from 30 minutes-same day as vaccination).

One case met level 1 of the BC criteria: medical history did not report recent infections or previous auto-immune disorders but time to onset (4 days) is plausible with the clinical manifestation of GBS. Two additional cases (AER# (b) (6), AER# (b) (6)) met level 2 of BC: although the medical history did not include mentioning of recent infections or previous auto-immune disorders, the reported time to onset (2 days with a progression of the symptoms over the next 20 days after vaccination; 18 days; 11 days, respectively) is plausible with the clinical manifestation of the syndrome.

An estimated 75,397,549 doses of Pfizer-BioNTech COVID 19 Vaccine were administered globally through 28 February 2021.

The ratio of observed to expected cases does not exceed 1 over either risk window.

Overall, given the totality of the available information, changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

APPENDIX 5.1 OBSERVED VERSUS EXPECTED ANALYSIS FOR ADVERSE EVENTS OF SPECIAL INTEREST

2.5. INTRODUCTION

As part of ongoing signal detection activities, MAH is conducting observed to expected analyses to determine whether the reported counts of spontaneously reported AESI are higher than expected based on the “natural” background rates of the AESI in the absence of exposure, as outlined in the “Considerations on core requirements for RMP’s of COVID-19 vaccines: coreRMP19 guidance”¹ and by Mahaux et al.² Analyses are reported cumulatively for the period since the vaccine was first granted emergency use authorization (9 December 2020) as well as for the monthly reporting interval (1 February 2021 – 28 February 2021).

2.6. METHODS

2.6.1. Variables

The AESI list included in this report is informed by recommendations from the following expert groups and regulatory authorities: Brighton Collaboration (SPEAC), ACCESS protocol, US CDC (VAERS surveillance) and MHRA. For SMSR 3, MAH has added several events to the unadjusted observed to expected ratio (O/E) analyses compared with SMSR2: Acute liver injury, Anosmia/ageusia, Arrhythmia, Chillblains, Coronary artery disease, Cutaneous vasculitis, Haemorrhage, Heart failure, Herpes zoster, Limb ischemia, Meningitis, Multisystem inflammatory syndrome (MIS), Myasthenia Gravis, Peripheral neuropathy, Vasculitis

2.6.2. Data Sources and Analysis

2.6.2.1. Observed cases

Spontaneously reported case counts are processed from the safety database via the pre-defined MedDRA search criteria provided in the results tables (Section 2.7). Unless otherwise noted in each table, events have not undergone adjudication, which is considered appropriate in a setting where the goal of the O/E analysis is signal detection.²

2.6.2.2. Expected cases

Expected case counts were determined cumulatively and for the monthly interval by multiplying estimated background incidence rates by the duration of post-vaccination exposure time (ENCePP, 2010). Duration of exposure time was estimated for the cumulative and interval period overall and using a 21-day risk window, the estimated period after vaccination during which acute vaccine-associated events are expected to occur.³

- Background incidence rates: Sources of background incidence rate estimates are noted in footnotes to the tables and include the literature as well as analyses conducted within electronic health records database and include, where available data from ACCESS project.¹¹ If a plausible range of background rates was identified across multiple data sources, a single rate from the low end of the range was selected.

090177e19681e9ed\Approved\Approved On: 13-Mar-2021 06:18 (GMT)

This conservative approach is more likely to identifying a signal than an approach using a higher background rate⁴

- **Post vaccination exposure time:** Estimated exposure time was derived from publicly available information reported by countries where Pfizer-BioNTech vaccine is authorized.⁵ For periods when more than one vaccine was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report. Exposure time was calculated assuming both a 21-day risk window and without assuming a risk window for both the interval and cumulative period.
 - Of note, the 21-day risk window is not applied to the observed case count. All cases observed during the interval or cumulative period are included regardless of proximity of event to date of vaccination. This is a conservative approach for the purpose of signal detection.

2.7. RESULTS: OBSERVED VS EXPECTED ANALYSES

An estimated 75,397,549 doses of Pfizer-BioNTech COVID 19 Vaccine were administered globally through 28 February 2021.

- d. Study C4591004

For most cumulative and interval data, the upper limit of the 95% CI is substantially less than 1.

For most events, the ratio is higher in the interval period than in the cumulative, even when restricted to the 21-day risk window. This could reflect changes in the accuracy of the person year estimate, increased reporting rate over time, an increased reporting rate with second dose as the proportion of vaccinees receiving a second dose is increasing over time, higher rates of spontaneous event reporting in countries where the vaccine was recently authorized, or a combination of these.

Anosmia/ageusia, meningitis, peripheral neuropathy, transverse myelitis, and myasthenia gravis were found to have a 95% CI is greater than 1 for at least one of the risk periods (cumulative/interval) or risk windows (21-weeks, no risk window). While typically the lower level of the 95% CI would be the criterion for evaluating a difference from expectation, in this setting, given the generally substantial gap between the lower limit and 1, an upper limit in excess of one might suggest the possibility of an excess risk in vaccinees. These events are further described in the Discussion.

2.8. DISCUSSION

2.8.1. Cardiogenic shock and postural orthostatic tachycardia syndrome

At this time, although included as requested by regulatory authorities to be included as AESI, relevant background rates have not been identified for the analysis of cardiogenic shock and postural orthostatic tachycardia syndrome.

2.8.2. Anosmia/Ageusia

For anosmia/ageusia, the lower level of the confidence interval exceeds 1 for both the cumulative and interval (01-28 Feb 2021) risk periods and for the no risk window and 21-day risk windows, suggesting that the observed rate of this outcome is higher in vaccinees in comparison to the background rate, generated from 2019 medical records. Anosmia/ageusia is notably a symptom of COVID-19 illness. Contemporaneous background rates of this endpoint are therefore likely to be increased in the background due to COVID-19 compared to the 2019 data used for the background rate. The MAH's COVID-19 vaccine requires 2-doses spaced 21-days apart before achieving maximum effectiveness. It is possible that within the 21-day window especially that COVID-19 may occur. Alternatively, general awareness of anosmia/ageusia is currently increased as a result of COVID-19 compared with 2019. Cases of anosmia/ageusia reported in this report will be reviewed and described in the next SMSR.

2.8.3. Meningitis, Myasthenia gravis, Transverse myelitis, Peripheral neuropathy

For Meningitis, Myasthenia gravis, Transverse myelitis, and Peripheral neuropathy the upper level of the 95% confidence interval exceeds one for at least one of the cumulative or interval risk periods, suggesting the possibility that the true O/E may exceed 1. As these rates are not related to COVID, we would not expect contemporaneous rates to be higher than in the historical periods used for determining background rates. These are known potential risks of vaccines and would be likely to be reported. Cases of the events reported in this report will be reviewed and described in the next SMSR.

2.8.4. Age-Adjustment

The MAH is aware of requests for age-stratified O/E analyses for Bell's palsy and serious ear and labyrinth disorders *as per EMA PRAC assessment report (Product No. EMEA/H/C/005735/MEA/002.1)*. At this time, the MAH is not able to provide these because accurate information about age-distribution of vaccine is unknown and challenging to estimate given the country-specific guidelines for populations to prioritize for vaccination as well as differences in population structure. The MAH will continue to try to identify relevant sources of information to allow for age-adjusted O/E estimates.

2.8.5. Limitations

There are several limitations to observed to expected analyses for signal detection. The observed case counts are likely to be underestimated due to underreporting that occurs with spontaneous report surveillance. Additional reasons for underestimations includes incomplete reporting and lags in reporting. Spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine are

more likely to be reported even if they do not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are more likely to be underreported due to lack of recognition of a potential association.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus the exposure is underestimated. Additionally exposure post dose 1 and dose 2 is not differentiated such that any differences in risk of AESI between dose 1 and dose 2 is not measured.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. The background rates used in this analysis are derived from one large US electronic health records database, one large US insurance claims database, EU- health care systems, or regional studies published in the literature and the majority of exposure data derives from the US. However, it is possible that the delivery of health care, population demographics, and underlying health status of the populations used for the background rate estimates differ from those expected in the persons administered the vaccine.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods: 21 days and unlimited time are the risk windows selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (unlimited window) The 21-day risk window is potentially conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

2.9. OBSERVED TO EXPECTED ANALYSES FOR ANAPHYLAXIS (IDENTIFIED RISK)

Given that anaphylaxis is an identified risk, the goal of an observed to expected comparison would not be signal identification but risk estimation. Risk of anaphylaxis is reported per dose administered in comparison with rates observed for other vaccines rather than in an unexposed population.

The MAH has conducted unadjusted observed to expected ratio (O/E) analyses after reviewing the 1232 cumulative cases of anaphylaxis occurring outside of a clinical trial setting reported in the global safety database. Anaphylaxis cases were identified using the MedDRA version 23.1 SMQ Anaphylactic reaction (broad with algorithm applied) and then focusing on cases presenting any symptom on day 0 (vaccination day). Cases assessed as Brighton Collaboration Levels 1-2 are included (N=766) in the analysis. A background rate¹⁵ of vaccine anaphylaxis 1.31 per million doses was assumed.

An estimated 75,397,549.3 doses of Pfizer-BioNTech COVID 19 vaccine have been administered through 28 February 2021. This estimate is derived from publicly available information reported by countries where Pfizer-BioNTech vaccine is authorized.⁵ For periods when more than one vaccine was authorized for use in each country, the doses

administered were assumed to be divided equally by the number of vaccines approved. This estimate does not reflect exposure in persons vaccinated in countries that did not publicly report.

For each event, expected counts were determined by multiplying the number of doses administered by the expected rates per dose.

An O/E ratio of 7.76 (95% CI, 7.22, 8.33) was observed for BNT162b2 compared with the background rate for anaphylaxis cases observed in the US.¹⁵ This rate has declined from the 9.47 (95% CI, 8.61 – 10.40) reported in SMSR2, which included events reported through January. However, whether the decline reflects decreased reporting, changes in the accuracy of the exposure estimate, or changes in population being vaccinated is unknown.

There are several limitations to consider when interpreting these analyses. The analyses did not adjust for differences in characteristics between persons being administered the vaccine and populations from which the background rate is derived such as age and comorbidities. At this time, national/local guidelines typically recommend prioritizing vaccine administration for healthcare workers at high-risk of COVID-19 exposure and persons with underlying conditions who are at risk of serious COVID-19 illness, including the elderly and those with underlying health conditions. The spontaneous reports system likely underestimates the true number of observed events in vaccinated persons due to incomplete reporting or a lag in reporting.

On the other hand, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine, eg, due to news media reports, are more likely to be reported than other events. With respect to the expected number of events, estimates concerning both exposure to vaccine and the background rate have limitations. This exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the total doses of vaccine administration used to determine the expected count of events is potentially underestimated.

Further, the delivery of health care, population demographics, and underlying health status of the populations included in the background rate estimates differ from those expected in the persons administered the vaccine.

APPENDIX 6. LITERATURE REVIEW IN THE REPORTING PERIOD (METHODOLOGY)

A web-based literature review service is used to review medical literature from clinical and non-clinical literature sources for significant safety information relevant to authorized Pfizer medicinal product including reviews and practice guidelines.

The following bibliographic databases are searched in this order:

1. MEDLINE®
2. Embase

Each search uses controlled vocabulary terms that are unique to each database. For each database, the search focuses on the following:

- AEs, effects and outcomes
- Generic name of the drug
- Prenatal and perinatal exposure and exposure through breast milk
- Drug interactions
- Clinical studies
- Epidemiology and meta-analyses
- Poisoning and toxicity
- Drug resistance and drug tolerance
- Toxicity tests

Searches are limited by date and by literature type. Editorials, and news reports (i.e., works consisting of an announcement or statement of recent or current events of new data and matters of interest in the field of medicine or science) are excluded because they are not peer-reviewed.
