## APPENDIX 2.6: Cumulative and Interval Summary Tabulation of Serious and Non-Serious Adverse Reactions From Post-Marketing Sources Organized per MedDRA System Organ Class by High Level Term

Cumulative Reporting Period: Through 29-APR-2021

Interval Reporting Period: 01-APR-2021 Through 29-APR-2021

Total Number of Cases: 30,752 (Interval) / 109,692 (Cumulative)

Total Number of Adverse Events (PT): 112,695 (Interval) / 414,597 (Cumulative)

MedDRA Version: v.23.1J

*System Organ Class*

### APPENDIX 2.6.1: Cumulative and Interval Summary Tabulation of Serious and Non-Serious Adverse Reactions From Post-Marketing Data Sources Organized per MedDRA System Organ Class by High Level Term per Country

Cumulative Reporting Period: Through 29-APR-2021

Interval Reporting Period: 01-APR-2021 Through 29-APR-2021

Total Number of Cases: 30,752 (Interval) / 109,692 (Cumulative)

Total Number of Adverse Events (PT): 112,695 (Interval) / 414,597 (Cumulative)

MedDRA Version: v.23.1J

Country Where Event Occurred

**Appendix 3 (Referred to in Section 9.2 Overview of Signals)**

**Tabular Summary of Safety Topics and Signals Evaluated During the Reporting Period**

**Product name: PF-07302048 (BNT162b2)**

**Reporting interval: 01 April 2021 – 29 April 2021**

Please note the following items that were included in SMSR #4 (01 Mar – 31 Mar 2021) and are therefore not included in the table below:

- On 06 April 2021, the safety topics Anosmia and Ageusia were determined not to be validated signals.
- On 06 April 2021, the safety signal Extensive swelling of vaccinated limb was reviewed and determined not to be a risk.

**Table 1. Tabular Summary of Safety Topics and Signals Evaluated During the Reporting Period**

Signal Term	Date Detected	Status (ongoing, or closed)	Date Closed (for closed signals)	Source or trigger of signal	Reason for evaluation and summary of key data	Method of signal evaluation	Action(s) taken or planned
<b>Signals Determined to be Risks</b>							
On 27 Apr 2021, based on review of unblinded clinical study C4591001 safety data (data lock date 13 Mar 2021), and supported by post-authorization AE reports, the following AEs were determined to be causally associated adverse reactions for Pfizer/BNT COVID-19 Vaccine: Asthenia, lethargy, decreased appetite, hyperhidrosis, night sweats. These reactions will be added to the company core data sheet and subsequently to the local product label as per Pfizer and BNT regulatory submission processes.							
<b>Signals Determined not to be Risks</b>							
Herpes Zoster, including Ophthalmic herpes zoster	05 Oct 2020 as safety topic.  Reopened 21 Feb 2021  Re-opened 26 Apr 2021	Closed	14 April 2021  30 Apr 2021	Reports of herpes zoster in clinical studies and post-authorization AE reports on non-statistical line listing review	Initially opened as safety topic and closed as no risk following review of clinical study data (C4591001).  To determine if herpes zoster including ophthalmic herpes zoster is a risk	05 Oct 2020: Review of clinical study data.  21 Feb 2021: Review of post-authorization safety and O/E analyses  30 Apr 2021: Review of post-authorization, clinical study and O/E data	The available data do not support a causal association with the vaccine. The topic will continue to be monitored.  The re-evaluation of this signal in April 2021 confirmed the above assessment

**Table 1. Tabular Summary of Safety Topics and Signals Evaluated During the Reporting Period**

Signal Term	Date Detected	Status (ongoing, or closed)	Date Closed (for closed signals)	Source or trigger of signal	Reason for evaluation and summary of key data	Method of signal evaluation	Action(s) taken or planned
Seizure	01 Mar 2021	Closed	06 May 2021	Routine review of post-authorization neurological events  Request from a health authority (Saudi Arabia)	To determine if seizure is a risk	Clinical study and post-authorization safety database review	The available data do not support a causal association with the vaccine. The topic will continue to be monitored.
Myocarditis and Pericarditis	15 Feb 2021  Re-opened 19 April 2021	Closed	05 May 2021	Ongoing discussions with a health authority (Israel MoH)  Request from a health authority (MHRA)	To determine if myocarditis or pericarditis is a risk	Clinical study and post-authorization safety database review	The available data do not support a causal association with the vaccine. The topic will continue to be closely monitored.
<b>Safety Topics Determined not to be Validated Signals</b>							
Nephrotic syndrome	29 Apr 2021	Closed	05 May 2021	Literature case report	To determine if this topic is a validated signal	Post-authorization safety database review	Based on the available data, this safety topic was determined not to be a validated signal
Trigeminal Neuralgia	29 Apr 21	Closed	05 May 2021	Communication from Uppsala Monitoring Centre	To determine if this topic is a validated signal	Clinical study and post-authorization safety database review	Based on the available data, this safety topic was determined not to be a validated signal
Hemolytic Anemia	16 April 2021	Closed	23 April 2021	Spontaneous Reports	To determine if this topic is a validated signal	Clinical study and post-authorization safety database review	Review of the available data do not support this topic as a validated signal

**Table 1. Tabular Summary of Safety Topics and Signals Evaluated During the Reporting Period**

Signal Term	Date Detected	Status (ongoing, or closed)	Date Closed (for closed signals)	Source or trigger of signal	Reason for evaluation and summary of key data	Method of signal evaluation	Action(s) taken or planned
Optic Neuritis	13 April 2021	Closed	23 Apr 2021	Request from a health authority (Singapore)	To determine if this safety topic is a validated signal	Clinical study and post-authorization safety database review	Review of the available data do not support this topic as a validated signal
Cranial nerve palsy	13 April 2021	Closed	23 Apr 2021	Request from a health authority (Singapore)	To determine if this safety topic is a validated signal	Clinical study and post-authorization safety database review	Review of the available data do not support this topic as a validated signal
Hepatic events	01 Mar 2021	Closed	19 Apr 2021	Reports of post-authorization serious hepatic events	To determine if serious hepatic events are a validated signal	Clinical study and post-authorization safety database review	Based on the available data, this safety topic was determined not to be a validated signal
<b>Ongoing Signals/Safety Topics</b>							
NA							

**Appendix 3.1 (Referred to in Section 9.2 Overview of Signals)**

**Summary of Safety Topic and Signal Evaluations**

Table 1 presents summaries of safety topics and signals for PF-07302048 (BNT162b2) during the current reporting period.

Please note the following items that were included in SMSR #4 (01 Mar – 31 Mar 2021) and are therefore not included in the table below:

- On 06 April 2021, the safety topics Anosmia and Ageusia were determined not to be validated signals.
- On 06 April 2021, the safety signal Extensive swelling of vaccinated limb was reviewed and determined not to be a risk.

**Table 1. Summary of Safety Topic & Signal Evaluations During the Reporting Period**

Signal/Topic	Summary of Evaluation
<b>Signals determined to be risks</b>	
Asthenia, Lethargy, Decreased appetite, Hyperhidrosis, Night sweats	On 27 Apr 2021, based on review of unblinded clinical study C4591001 safety data (data lock date 13 Mar 2021), and supported by post-authorization AE reports, the following AEs were determined to be causally associated adverse reactions for Pfizer/BNT COVID-19 Vaccine: Asthenia, lethargy, decreased appetite, hyperhidrosis, night sweats. These reactions will be added to the company core data sheet and subsequently to the local product label as per Pfizer and BNT regulatory submission processes.
<b>Signals determined not to be risks</b>	
Herpes Zoster, including Ophthalmic herpes zoster	Reports of herpes zoster have been followed closes in Study C4591001 and the post-authorization period. In April, a request was received by the Swiss health authority (SwissMedic) to review cases of herpes zoster including ophthalmic herpes zoster. An evaluation of the available clinical study data and post-authorization data do not support a causal association of herpes zoster in any form with the use of Pfizer/BNT COVID-19 vaccine.
Seizure	Seizures occurring after vaccination are monitored as per routine pharmacovigilance for Pfizer/BNT COVID-19 vaccine. A request for information on the topic by a health authority (Saudi Arabia FDA) prompted a review of seizures/convulsions. An evaluation of the available information is included in the current SMSR; it concluded that the present data do not support a causal association with the Pfizer/BNT COVID-19 vaccine.
Myocarditis and Pericarditis	During regular meetings with a health authority (Israeli Ministry of Health), cases of myocarditis in young males (some in Army recruits) were discussed due to their temporality to vaccination with Pfizer/BNT COVID-19 vaccine. Subsequently, requests from other health authorities were received. An evaluation including all available information is included in the current SMSR; it concluded that the present data do not support a causal association with Pfizer/BNT COVID-19 vaccine and the topic will continue to be closely monitored.
<b>Safety topics determined not to be validated signals</b>	
Nephrotic syndrome	A review of this topic was undertaken following receipt of a literature cases report of minimal change disease and nephrotic syndrome after vaccination <sup>1</sup> . Following

**Table 1. Summary of Safety Topic & Signal Evaluations During the Reporting Period**

Signal/Topic	Summary of Evaluation
	review of the post-authorization safety database cases, this topic was determined not to be a validated signal.
Trigeminal neuralgia	A review of this topic was undertaken following receipt of a draft signal report in a communication from Uppsala Monitoring Centre. Following review of clinical study and post-authorization safety database cases, this topic was determined not to be a validated signal
Hemolytic anemia	A review of this topic was undertaken following routine review of spontaneous AE reports. Following review of clinical study and post-authorization safety database cases, this topic was determined not to be a validated signal
Optic neuritis	A review of this topic was undertaken following a request from a health authority (Singapore). Following review of clinical study and post-authorization safety database cases, this topic was determined not to be a validated signal
Cranial nerve palsy	A review of this topic was undertaken following a request from a health authority (Singapore). Following review of clinical study and post-authorization safety database cases, this topic was determined not to be a validated signal
Hepatic events	A review of this topic was undertaken following routine review of spontaneous AE reports. Following review of clinical study and post-authorization safety database cases, this topic was determined not to be a validated signal.
<b>Ongoing evaluations of safety topics or signals</b>	
Not applicable

## **APPENDIX 3.2 SAFETY EVALUATION OF POLYNEUROPATHY AND NEUROPATHY PERIPHERAL**

### **1. INTRODUCTION**

Because the ratio of observed to expected cases analyses for Polyneuropathy in the 4<sup>th</sup> March summary monthly safety report (SMSR) exceeded 1 over both risk windows ( 21 days and no risk window) for the interval period analysis (01 March 2021 through 31 March 2021), a full evaluation was performed. In the 3<sup>rd</sup> (February) SMSR, peripheral neuropathy was found to have a 95% CI very close to 1 for the interval 21-day risk window, and the topic was evaluated and determined not to be a validated signal. This report updates the review of peripheral neuropathy and includes a review of polyneuropathy.

### **2. METHODOLOGY**

The Pfizer safety database was searched for PT Polyneuropathy and PT Neuropathy peripheral reported cumulatively up to the 31<sup>st</sup> March 2021.

Phase 2/3 Study C4591001 placebo-controlled unblinded data (data cutoff date 13 March 2021) was also reviewed for the adverse events PT Polyneuropathy and PT Neuropathy peripheral.

The analysis of the 2 different PTs reported was performed separately.

### **3. NEUROPATHY PERIPHERAL**

#### **3.1. RESULTS OF SPONTANEOUS CASES OF NEUROPATHY PERIPHERAL**

Based on the search strategy provided above, a total of 152 spontaneous cases were retrieved from Pfizer safety database.

There were 113 females, 32 males, and in 7 cases sex was not reported. All 152 cases were reported as serious. Cases originated mainly from the United States (61), United Kingdom (37), Italy (12), and Japan (10).

Age distribution was as follows: 18-30 years (12); 31-50 years (56); 51-64 years (29); 65-74 years (27); Greater than or equal to 75 years (10), and age was unknown in 18 cases (mean = 52 years; n = 133).

Upon review of reported medical history, 51 cases reported the following pre-existing conditions (some cases reported more than one condition): Autoimmune thyroiditis, Bursitis, Cerebral infarction, Cerebrovascular accident, Diabetes mellitus, Fibromyalgia, Guillain-Barre syndrome, Hereditary spastic paraplegia, Immunodeficiency, Intervertebral disc protrusion, Lumbar vertebral fracture, Meniscus operation, Multiple sclerosis, Muscular weakness, Myelitis, Nerve injury, Neuropathy peripheral, Pain in extremity, Polyneuropathy,

Posterior tibial nerve injury, Raynaud's phenomenon, Sjogren's syndrome, Small fiber neuropathy, Spinal operation, Systemic lupus erythematosus, Upper limb fracture, and Wrist surgery.

Out of these 51 cases reporting pre-existing condition(s), 8 cases reported worsening or exacerbation of peripheral neuropathy.

Out of the overall dataset of 152 cases, 35 cases reported peripheral neuropathy as the only PT.

The most commonly co-reported events reported were: Paraesthesia (32), Arthralgia, Fatigue (27 each), Headache (25), Pain in extremity (21), Pyrexia (19), Pain (18), Myalgia (17), Chills (15), Hypoesthesia, Nausea (14 each), Vaccination site pain (11), Burning sensation, Dyspnoea, Malaise (10 each). Twenty-one (21) cases reported pre-existing asthma and/or allergies.

The majority of 152 patients reported the event post Dose 1. Out of 152 cases, one case reported electromyography result (a 55-year-old female patient who experienced Neuropathy peripheral, Paraesthesia, Feeling cold, Peripheral coldness, Bone pain, Arthralgia, Burning sensation, and Pain in extremity after second dose; had multiple tests done including electromyogram with negative results).

The latency was reported for all 152 Neuropathy peripheral events. Table 1 below presents latency in days.

**Table 1. Latency in Days per Neuropathy peripheral Event**

Latency in Days	Number of Events
0 days	33
1 day	39
2 days	9
3 days	13
4 days	5
5 days	4
6 days and 7 days	6 (3 each)
11 days and 12 days	4 (2 each)
8, 9, 10, 14, 20, 24, 29 days	7 (1 each)

When reported (for 15 out of 152 events), the duration of peripheral neuropathy was 2 hours (for 1 event), within 1 day (for 4 events), 2 days (for 5 events); 3 days, 6 days (for 2 events each); and 8 days (for 1 event).

The outcomes were reported as follows: not resolved for 58 events, resolved/resolving for 61 events, resolved with sequelae for 5 events, and unknown for 28 events.

### 3.2. CLINICAL TRIAL DATA

In the Phase 2/3 Study C4591001, the event peripheral neuropathy (PT Neuropathy peripheral) was reported in 1 (0.0%) participant out of 21,926 in the BNT vaccine group and 3 (0.0%) participants out of 21,921 in the placebo group from dose 1 to 1 month after dose 2 in subjects  $\geq 16$  years of age.

### 3.3. SUMMARY

The majority of spontaneous cases of peripheral neuropathy were reported in females from the age of 31 years through 64 years. Most events occurred 1-day post vaccination date (post dose 1), with the most common outcome per the event of resolved/resolving.

## 4. POLYNEUROPATHY

### 4.1. RESULTS OF SPONTANEOUS CASES OF POLYNEUROPATHY

A total of 13 spontaneous cases were retrieved using the search criteria described above.

There were 10 females and 3 males. Age ranged between 38 and 84 years (mean: 59; N: 11). Seven cases were reported by adults ( $\geq 18$  to  $< 65$  years), 4 by elderly ( $\geq 65$ ) and for 2 subjects age was not reported. Case outcome was reported as not recovered at time of reporting in 6, recovered/recovering in 5 and unknown in 2. Most cases were reported from France (3), followed by Germany and US (2 cases each). All cases were assessed as serious.

Medical history was reported for 7 patients, and among them 3 cases reported a pre-existing polyneuropathy, 2 cases reported arthritis (one of them was co-reported with Extranodal marginal zone B-cell lymphoma and another one was co-reported with Aortic valve incompetence/ Hypothyroidism / Neurodermatitis conditions). The remaining 2 cases reported previous COVID 19 and back pain/injury respectively.

Time to onset was reported for 12 of the cases and ranged from immediately after vaccination to 12 days after vaccination (mean: 2.8 days; median: 0.5 day; N: 12).

The 3 patients ( (b) (6) , (b) (6) and (b) (6) ) reporting a polyneuropathy in the medical history reported that this event was a worsening/flare of polyneuropathy.

Details of the 10 cases that did not report underlying polyneuropathy will be described below:

One case ( (b) (6) ) reported symptoms on the day of vaccination; she was diagnosed with myelitis and mild polyradiculoneuritis. The time to onset was a short time (less than a day) after vaccination therefore biologic plausibility is questionable.

One case ( (b) (6) ) reported tetraparesis with a normal MRI on the same day as vaccination. Similarly, to the case described above, the short time to onset does not support biological plausibility of the event to be correlated with the vaccine.

Another case reported ( (b) (6) ) 8 hours after dose 2 symptoms of myalgia with ataxic gait, motor deficit, sensory disorder. EMG and other examination were normal, and the physician reported that "It is possible that she had a reaction to the vaccination, but I think the sensory motor manifestations are functional".

One patient ( (b) (6) ) with a medical history of extranodal marginal zone B-cell lymphoma and rheumatoid arthritis reported polyneuropathy 1 day post vaccination and specified that she had similar symptomatology when she received the flu vaccination (date not reported).

Three cases ( (b) (6) , (b) (6) , (b) (6) ) reported only sensory symptoms starting 3 days post vaccination (for all 3 cases). Two had an outcome of recovered/recovering (duration of 7 days) and 1 of not recovered.

One case ( (b) (6) ) reported left ulnar nerve polyneuritis 12 days post vaccination. Ulnar nerve neuritis is often reported due to trapping of the nerve on the elbow usually after trauma, deformities (eg, rheumatoid arthritis), metabolic derangements (eg, diabetes), transient occlusion of the brachial artery during surgery and is not generally associated with deltoid vaccination.

The remaining 2 cases did not report any medical history; one reported autoimmune-mediated arm plexus neuritis/brachial plexus neuritis, polyneuropathy and left arm paresis ( (b) (6) ) with a time to onset on the day of vaccination and the last case ( (b) (6) ) reported 12 days after vaccination polyneuropathy with EMG confirming the diagnosis (EMG: sensory and motor polyradiculoneuritis in the lower limbs).

## 4.2. CLINICAL TRIAL DATA

In the Phase 2/3 Study C4591001 safety population, Polyneuropathy was not reported in participants in either the BNT vaccine or placebo groups from dose 1 to 1 month after dose 2 (data cut off: 13 Mar 2021).

## 4.3. SUMMARY

In summary most cases report a time to onset of the same vaccination day (7) or one day after (1) which is not likely to be sufficient time to develop an immune response able to trigger the symptoms. Most cases (except 1) do not report any diagnostic examination to support the polyneuropathy diagnosis. Overall, there is a paucity of cases with sufficient detail.

## 5. CONCLUSIONS

The totality of the available information, including the lack of reports with objective evidence and for polyneuropathy and peripheral neuropathy, do not support them being validated signals for the vaccine. No updates to the product information label are warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

## APPENDIX 3.3 SAFETY EVALUATION OF HERPES ZOSTER

### 1. INTRODUCTION

Herpes zoster (shingles) results from reactivation of latent varicella zoster virus (VZV). The lifetime risk of zoster is estimated to be 10–30% and incidence increases markedly with age, affecting up to 50% of people who live to 85 years. It is characterized by a painful vesicular dermatomal rash and can result in chronic pain (post-herpetic neuralgia), particularly in older individuals. The virus is thought to be maintained in its latent form by VZV-specific cell-mediated immunity. Therefore, people with cell-mediated immunosuppression are at increased risk of zoster. However, these individuals only constitute a minority of zoster cases in population-based studies, and the precise determinants of VZV reactivation in people without underlying immunosuppression are unknown. Case reports and case series have suggested that mechanical trauma precipitates zoster in the affected dermatome, perhaps because stimulation of the nerve triggers reactivation of virus in the dorsal root ganglion. A recent study investigated genetic susceptibility to zoster, studying polymorphisms at the promoter region of the gene for interleukin 10 (a cytokine that can downregulate cell-mediated immunity). A significantly higher proportion (53%) of 60 immunocompetent patients with zoster carried the ATA haplotype at this region of the gene compared with 152 (38%) of 400 blood donors. It is unclear whether the risk of zoster is increased in females. Women might be more likely to seek medical advice for their zoster compared with men or may have increased prevalence of risk factors for zoster, or there may be some biological mechanism by which women are more susceptible to VZV reactivation. An increased incidence of zoster in women is unexpected given the findings from a range of studies that strongly suggested that varicella contacts protect against zoster, because women might be expected to have more social contacts with children (and therefore with varicella) compared with men. However, the lower zoster incidence in women aged 35–44 years in the Rochester study (in the pre-HIV era) and the lower risk in the same age group in the MSGP4 analysis could indicate increased contacts with school-age children (and therefore with varicella), offsetting any increased risk in women due to other factors. Psychological stress was identified as a potential risk factor for zoster that might operate by suppressing cell mediated immunity.

Additional risks factor for herpes Zoster reactivation among adults has been analyzed by Marin M et al., the article concluded that personal and family history of HZ, stress, sleep disturbance, depression, and recent weight loss were risk factors for HZ. Reactivation of dormant herpes zoster virus leading to HZD typically arises during immunocompromised or weakened immunity states, such as cancer, HIV, immune-senescence, and long-term corticosteroid use. Vaccination, including the influenza vaccine, can decrease the frequency and function of T-regulatory cells. Depletion of these cells may enable a state of immune *dysfunction*, rather than true immunocompromise, that allows for opportunistic infections.

## 2. METHODOLOGY

Pfizer's safety database contains cases of adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality. The Pfizer safety database Argus was searched for all BNT162b2 vaccine spontaneous and literature reports and serious clinical trial reports received through 31 March 2021 using the following MedDRA version 23.1 search criteria: PT: Herpes Zoster.

For completeness a separate analysis will be conducted using the following PTs: Herpes zoster infection neurological, Varicella zoster virus infection, Herpes zoster cutaneous disseminated, Herpes zoster oticus, Ophthalmic herpes zoster, Herpes zoster reactivation received through 31 March 2021 using the following MedDRA version 23.1.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

Phase 2/3 Study C4591001 placebo-controlled unblinded data (data cutoff date 13 March 2021) was also reviewed for the adverse events Herpes zoster.

## 3. RESULTS

A total of 823 cases were retrieved using the search criteria mentioned above. There were 530 (64.4%) female, 245 (29.8 %) male and for 48 (5.8%) gender was not reported.

Age was reported for 709 subjects and ranged from 19 to 103 years (mean: 59.6, median: 60; N:709). A total of 373 (45.3%) events have been assessed as serious and 450 (54.7%) as non-serious.

A total of 419 cases were reported in adults ( $\geq 18 < 65$ ), 195 were reported in elderly ( $\geq 65$ ) and for 109 cases age was not reported. Age stratification is shown in Table 1.

**Table 1. Age Stratification**

Age Range	Number of Cases	Percentage (%)
18 - 30 years	39	4.7 %
31 - 50 years	181	22.0 %
51 - 64 years	199	24.2 %
65 - 74 years	131	15.9 %
Greater than or equal to 75 years	164	19.9 %
Unknown	109	13.2 %

Most cases were reported from the UK (292, 35.5%) and from the US (210, 25.5%). A detail reporting from the top ten reporting countries is reported in Table 2.

**Table 2. Top 10 Reporting Countries**

Countries	Number of Cases	Percentage (%)
UNITED KINGDOM	292	35.5 %
UNITED STATES	210	25.5 %
FRANCE	73	8.9 %
GERMANY	45	5.5 %
ITALY	40	4.9 %
SPAIN	38	4.6 %
ISRAEL	20	2.4 %
GREECE	18	2.2 %
HUNGARY	11	1.3 %
AUSTRIA	9	1.1 %
SWEDEN	9	1.1 %

**Table 3. Number of Cases, Gender, Age and Seriousness by Country**

Country	Number of cases	Female	Male	Unknown gender	Serious cases	Non serious cases	Adult ( $\geq 18 < 65$ )	Elderly ( $\geq 65$ )	Unknown age
US	210	132	60	18	35	175	83	72	55
UK	292	200	80	12	198	94	150	122	20
EU	284	182	92	10	131	153	166	88	30

Rest of the world	37	16	13	8	9	28	21	7	9
<b>Tot</b>	<b>823</b>	<b>530</b>	<b>245</b>	<b>48</b>	<b>373</b>	<b>450</b>	<b>420</b>	<b>289</b>	<b>114</b>

Time to onset was reported from 621 cases and ranged from the same vaccination day to 81 days post vaccination (median 5 days; mean: 5.4 days). The vast majority (84%) reported time to onset within 2 weeks from vaccine administration with the majority being between the same vaccination day to 7 days after vaccination (63.7%) (Table 4).

**Table 4. Time to Onset of Herpes Zoster After Vaccine Administration**

Time to onset from vaccine administration	Number of cases
0-1 day	112 (18%)
2-4 days	181 (29.1%)
5-7	103 (16.6%)
8-14	126 (20.3)
15-30	85 (13.8%)
30-81	14 (2.2%)
Tot	621

A total of 95 subjects reported a medical history of Herpes Zoster, in addition 24 cases reported in the medical history neoplasm, 22 reported autoimmune disease and 18 Immunodeficiency.

Duration of Herpes Zoster was reported for 51 cases and ranged between 1 to 53 days (median 12 days; mean: 13.6). Outcome was reported as recovered/recovering/recovered with sequel in 354 (43%), 312 (37.9%) reported not recovered at the time of reporting and unknown for 157 (19.1) cases.

#### 4. BROADER ANALYSIS ON SPECIFIC HERPES ZOSTER REPORTING

An additional analysis on herpes Zoster including the followings PTs Herpes zoster infection neurological, Varicella zoster virus infection, Herpes zoster cutaneous disseminated, Herpes zoster oticus, Ophthalmic herpes zoster, Herpes zoster reactivation has been performed for completeness.

A total of 57 cases were retrieved using the search criteria mentioned above. The distribution by PTs is reported below in

**Table 5. Distribution by PTs**

PTs	Number of cases
Herpes zoster infection neurological	3
Varicella zoster virus infection	3

Herpes zoster cutaneous disseminated	3
Herpes zoster oticus	9 (5 associated with facial paresis/paralysis)
Ophthalmic herpes zoster	29
Herpes zoster reactivation	11
Tot*	58

\* 1 case reported 2 PTs

There were 39 females and 18 males. Age ranged between 35 to 93 years (mean: 66; N 54). There were 28 adults ( $\geq 18 < 65$ ), 26 were reported in elderly ( $\geq 65$ ) and for 3 cases age was not reported.

Outcome was reported as recovered/recovering/recovered with sequel in 29, not recovered at time of reporting for 25 and unknown in 3. Most cases were received from France (14), UK (14) Germany (9) and Spain (7). A total of 53 cases were assessed as serious and 4 as nonserious.

Medical history was reported for 34 cases and Herpes Zoster was reported in 13 cases and additional 8 subjects reported in the medical history Rheumatoid arthritis, chronic kidney disease, diabetes mellitus, Immune system disorder, ovarian cancer, hypothyroidism, previous COVID 19 , meningitis and Polymyalgia rheumatica.

Among them there were a total of 7 cases that reported associated the PT herpes zoster and were discussed already in the analysis above.

Time to onset was reported for 48 cases and ranged between the same vaccination day to 28 days post vaccination (mean: 6.8, median: 5 days). About 65% reported the time to onset between the same vaccination day and 7 days post vaccination.

A total of 39 subjects reported the vaccination dose and 28 cases reported the event after dose 1 and 11 after dose 2.

## 5. CLINICAL TRIAL DATA

In the Phase 2/3 safety population, Herpes zoster was reported in 12 participants (0.1%) of 21926 in the BNT162b2 group compared with 10 participants (0.0%) of 21921 in the placebo group in AEs reported from Dose 1 to 1 month post dose 2 during the blinded controlled follow up period.

In the Phase 2/3 safety population, Ophthalmic Herpes zoster was reported in 1 (0.0%), Herpes Zoster cutaneous disseminated in 0 (0.0%) and Herpes Zoster Oticus in 0 (0.0%) of 21926 participants in the BNT162b2 group, compared with Ophthalmic Herpes zoster reported in 1 (0.0%), Herpes Zoster cutaneous disseminated in 1(0.0%) and Herpes Zoster Oticus in 1 (0.0%) of 21921 participants in the placebo group in AEs reported from Dose 1 to 1 month post dose 2 during the blinded controlled follow up period.

## 6. EXPECTED VERSUS OBSERVED ANALYSIS

The MAH conducted unadjusted observed to expected ratio (O/E) analyses for the 873 reported herpes zoster cases. The O/E ratio was below 1 for both the 21-day risk window and no risk window, indicating there was not an increased risk of herpes zoster among recipients of the BNT162b2 vaccine.

**Table 5. Observed versus Expected (O/E) Analysis of 873 Spontaneously Reported Herpes Zoster Cases through 31 March 2021**

	<b>21-Day Risk Window (6,654,996 PY)</b>	<b>No Risk Window (14,657,849 PY)</b>
O/E ratio (95% CI)	0.030 (0.028, 0.032)	0.014 (0.013, 0.015)
Expected cases <sup>a</sup>	27,551.68	60,683.49

a. Derived from 4.14/1,000 PY background rate from Pfizer Internal Study C4591004

Observed case counts were identified using the PT codes included in the herpes zoster definition (herpes zoster, ophthalmic herpes zoster, herpes zoster reactivation, herpes zoster infection neurological, herpes zoster oticus, herpes zoster cutaneous disseminated, varicella zoster virus infection). Expected case counts were derived using a background incidence rate of 4.14 per 1,000 person years<sup>1</sup>. Person years of exposure estimates were derived from publicly available information reported by countries where the BNT162b2 vaccine is authorized<sup>2</sup>. For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report.

Herpes zoster rates are known to vary by age, ranging from age-specific incidence in a US cohort ranged from 0.86 per 1000 person-years in individuals <19 years of age to 12.78 per 1000 person-years among those 80 years of age and older, with substantial increase after 50 years of age. While age-specific exposure COVID-19 vaccine exposure data are lacking to enable an age-stratified or age adjusted O/E calculation, if we conservatively applied the 0.86/1000 PY rate to the 6,654,996 PY for the 21-day risk window, we would expect 5723 cases, far fewer than the 873 that were observed.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all 873 cases were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population. To date, the majority of exposure derives from the US.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

<sup>1</sup> Pfizer Internal Study C4591004.

<sup>2</sup> <https://ourworldindata.org/covid-vaccinations#daily-vaccination-rates> (accessed 1 April 2021).

## 7. CONCLUSION

As of 31 March 2021, a total of 823 cases reported Herpes zoster, for most of them time to onset was 2 to 7 days post vaccination (50.4%) and duration, when reported, ranged between 1 to 18 days. Most cases were reported in females and 60% of cases were reported in subjects 50 years and older. Of note, some patients were on immunosuppressants or oncologic chemotherapy treatment and some others had medical histories of autoimmunity or immunodeficiency.

Additional 50 cases were reported with PTs Herpes zoster infection neurological, Varicella zoster virus infection, Herpes zoster cutaneous disseminated, Herpes zoster oticus, Ophthalmic herpes zoster, Herpes zoster reactivation. Characteristics were similar to the ones reported for the PT herpes zoster with the vast majority being reported in females (68.4%), mostly in subjects >50 years of age (78.9%) and in subjects with a previous history of Herpes zoster, on immunosuppressants, medical histories of autoimmunity, immunodeficiency or frailty conditions.

Data from clinical trials did not show a difference in the occurrence of Herpes Zoster or ophthalmic herpes zoster in study participants receiving the vaccine compared to placebo. The ratio of observed to expected cases does not exceed 1 over either risk window.

Overall, given the totality of the available information, this signal does not suggest that herpes zoster is a risk of vaccination with BNT162b2. Therefore, changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit

risk profile of the vaccine remains favorable. The topic will continue to be monitored through routine PV.

## 1. INTRODUCTION

A convulsion, or seizure, is a transient occurrence of signs and symptoms due to abnormal excessive or synchronous neuronal activity in the brain. A seizure can be acute symptomatic for example close temporal association with a transient central nervous system or systemic insult or can be unprovoked for example occurring in the absence of precipitating factors and may be caused by a static or progressive injury. Seizures can be focal when originating within 1 part of a cerebral hemisphere or generalized when the initial activity is consistent with rapidly engaging networks distributing in bilateral cerebral hemispheres. Epilepsy is instead defined as a disorder of the brain characterized by an enduring predisposition to generate epileptic seizures. Approximately 8% to 10% of the population will experience a seizure during their lifetime and only about 2% to 3% go on to develop epilepsy.<sup>1</sup>

As per the report (version 1.2) by the ACCESS/VAC4EU initiative the estimated incidence rate of generalized convulsions/seizure (across various age categories and data sources for the population included in the health system catchment area<sup>1</sup>) is 29 per 100,000 person years.

The overall prevalence of active epilepsy is estimated to range between 5.4 and 6.9 per 1,000 subjects.<sup>2</sup> The estimated prevalence of epilepsy in children and adolescents ranges between 4.5 and 5.0 per 1,000 subjects; in ages 20–64 years the prevalence is 6 per 1000 subjects; in ages 65 years and older the prevalence is 7 per 1,000 subjects. Approximately 20–30% of the epilepsy population has more than one seizure per month. Based on the age-specific incidence rates in European studies, the estimated incidence amongst European children and adolescents is 70 per 100,000 subjects per year; in adults 20–64 years, the incidence rate is 30 per 100,000 subjects per year; in the elderly, 65 years and older the incidence is 100 per 100,000 per year.<sup>2</sup> Similarly to Europe, a US study reported the epilepsy prevalence within all US age groups was 6.8 per 1000.<sup>3</sup>

## 2. CONVULSION AND COVID-19

Neurological manifestations of COVID-19 have been described in up to 36% of patients [headache (13%), dizziness (17%), impaired consciousness (8%), acute cerebrovascular problems (3%), ataxia (0.5), and seizures (0.5%)] with COVID-19.<sup>4</sup> The neurological manifestations may be due to the direct presence of the virus in the cerebrospinal fluid (CSF) that may be an indirect consequence of hypoxia-, sepsis-, and inflammation-associated damage of biological barriers during the disease course. Nevertheless, there are several studies that report neurological dysfunction even in the absence of virus in the CSF, and rather argue against direct viral CNS penetration.<sup>5</sup> The hypothesis through which SARS-CoV-2 induces seizures in some patients is linked to a consequence of hypoxia, metabolic derangements, organ failure, or even cerebral damage.<sup>6</sup>

Case reports have been published describing meningitis/encephalitis associated with SARS-CoV-2.<sup>7</sup> Other cases<sup>8-11</sup> reported seizures in the context of SARS-CoV-2 infection without other neurological symptoms; a case was also reported where the primary presentation was

---

<sup>1</sup> ACCESS, Vaccine COVID-19 virus monitoring readiness. D3-Draft-Final-Report Version 1.2, 30Apr2021

focal status epilepticus.<sup>12</sup> Nevertheless, the number of reports with new onset or acute seizures in patients with COVID-19 in relation to the overall number of Covid-19 patients suggests that a relevant lowering of seizure thresholds is a rare event. Seizures may occur in patients with a severe condition and terminal stage patients, in whom an increased seizure susceptibility can be a consequence of fever and can be secondary to blood-brain barrier damage due to hypoxia or sepsis. Although the literature does not provide relevant evidence for seizure worsening in persons with epilepsy during the course of a SARS-CoV-2 infection, there are theoretical risks, for example, seizures triggered by fever.<sup>13-15</sup>

### 3. CONVULSION AND VACCINATION

Different scientific papers studied, using the vaccine adverse event reporting system (VAERS) database, the reporting frequency of seizures after trivalent inactivated influenza vaccine (TIV) in children 6-23 months of age: McMahon et al<sup>16</sup> reported that 17% of all serious adverse event reports were seizures occurring within 2 days after vaccination. Another study<sup>17</sup> reported an average reporting frequency of 34%. In a passive surveillance study, Hambidge et al<sup>18</sup> reported that after trivalent inactivated influenza vaccine (TIV) in children 6-23 months of age, a signal for convulsions in the 3 days risk window was not detected. Similarly, Goodman et al<sup>19</sup> could not confirm in their study the high seizure reports found in previous studies since they did not detect any signal for seizures, febrile or otherwise, in the 3-day risk window after TIV.

In 2010 during the pediatric influenza vaccination program in Western Australia an increase of febrile convulsion in children was detected upon use of the Fluvax formulation. The estimate rate of febrile convulsions in children under 5 years related to receipt of the 2010 Fluvax TIV was 3.3 per 1,000 doses which is high when compared with the reported rate of 1.4 per 100,000 TIV doses in 2004-2005 administered in the US.<sup>20</sup>

The frequency of convulsion/convulsion grand mal in adults ( $\geq 18$  years old) after vaccination has been reported as a rate of 0.16 per million vaccinations.<sup>21</sup>

- A specific correlation has been found with measles, mumps, rubella, and varicella vaccine (MMRV) in children aged 10–24 months that was found to be associated with an elevated risk of seizure or febrile seizure.<sup>22</sup> Similarly, also in older children (up to 5 years) MMRV was also associated with elevated risk of seizure or febrile seizure during the first two weeks after vaccination.<sup>23</sup>

### 4. METHODOLOGY AND CASE DEFINITION

The Pfizer safety database was searched for all BNT162b2 vaccine cases (spontaneous and clinical cases) received through 18 March 2021 using the MedDRA version 23.1 using the search criteria: SMQ: Generalised convulsive seizures following immunisation (SMQ) (Narrow scope).

For further review, medically confirmed cases, without reported co-suspect drugs, and with a reported latency were considered for further evaluation. Cases reporting anaphylaxis, anaphylactic reaction or hypersensitivity type reactions were considered confounded and not included in further review. Identified cases were divided into 2 groups, those without

confounding medical history/or relevant underlying medical conditions and those with relevant underlying conditions considered to have the potential of lowering the seizure threshold (such as epilepsy, history of seizure, stroke, cerebrovascular events, dementia).

Cases with a latency from vaccination of up to 7 days were individually reviewed. In addition, all fatal cases were reviewed individually.

Phase 2/3 Study C4591001 placebo-controlled unblinded data (data cutoff date 13 March 2021) was also reviewed for relevant adverse events.

## 5. RESULTS

### Clinical Trial Results:

In the Phase 2/3 Study C4591001 (data cut-off 13 March 2021), the event Generalised tonic-clonic seizure was reported in no (0.0%) participants out of 21,926 in the BNT vaccine group and 1 (0.0%) participant out of 21,921 in the placebo group from dose 1 to 1 month after dose 2 in subjects  $\geq$  16 years of age. The event term Seizure was reported in 1 (0.0%) participant in the vaccine group and none in the placebo group.

### Pfizer Safety Database Results

A total of 576 cases were retrieved from the Pfizer safety database using the search criteria above. A total of 355 (61.6%) were females, 195 (~33.8%) were males, and for 26 (~4.7%) subjects the gender was not reported. Age ranged from less than or equal to 16 years to greater than or equal to 107 years (mean 52.2 years; n=533). Case outcome was reported as follows: fatal in 28 cases, recovered/resolving/recovered with sequelae in 365 cases, not recovered at time of reporting in 72 cases, and unknown in 111 cases. Most cases were reported from UK (177), Mexico (74), US (58) and Germany (49) (see Table 1). Most cases were assessed as serious (568) [life threatening (52), hospitalization (184) disabling (20)]; 8 cases were reported as non-serious. All but 1 of the cases were spontaneous from post-marketing, one case was reported from a clinical study.

**Table 1. Cases Countries**

Countries	Number of Cases	Percentage (%)
UNITED KINGDOM	177	30.7
MEXICO	74	12.8
UNITED STATES	58	10.1
GERMANY	49	8.5
FRANCE	31	5.4
POLAND	24	4.2
ITALY	24	4.2
NETHERLANDS	24	4.2
SPAIN	14	2.4
BELGIUM	13	2.3
ISRAEL	10	
OTHER (26 countries)	78	

The most frequent events (from the Nervous system disorders SOC) in the 576 cases are summarized in the table below:

AE	n (%) (N = 576)
Seizure	352 (61.1%)
Epilepsy	134 (23.3%)
Headache	117 (20.26%)
Dizziness	74 (12.8%)
Generalised tonic-clonic seizure	60 (10.4%)
Loss of consciousness	51 (8.9%)
Febrile convulsion	39 (6.8%)
Syncope	35 (6.1%)
Tremor	27 (4.7%)
Status epilepticus	23 (4.0%)
Confusional State	14 (2.4%)
Tonic convulsion	11 (1.9%)
Paresthesia	10 (1.7%)
Depressed level of consciousness	10 (1.7%)

The most frequently co-reported events are summarized in the table below:

AE	n (%) (N = 576)
Pyrexia	93 (16.15%)
Dizziness	74 (12.85%)
Chills	65 (11.28%)
Asthenia	59 (10.24%)
Myalgia	59 (10.24%)
Pain	58 (10.07%)
Nausea	57 (9.90%)
Arthralgia	50 (8.68%)
Fatigue	48 (8.33%)
Malaise	37 (6.42%)
Dyspnoea	35 (6.08%)
Vomiting	35 (6.08%)
Sensitive Skin	32 (5.56%)

Of the 576 cases, 422 were medically confirmed. Of these, 377 cases provided a latency for the event between 0 up to 30 days. Ten (10) cases reported co-suspect drugs, and another 20 cases co-reported anaphylaxis, anaphylactic reaction, anaphylactic shock or hypersensitivity (2) alongside the relevant events and were also excluded from further review.

Of the remaining 347 cases, there were 201 cases without a confounding medical history, and 146 cases with reports of a confounding medical history (epilepsy, seizure, stroke or other relevant neurological condition such as Dementia/Alzheimer, Down's syndrome, cerebrovascular disorder or accident, leukoencephalopathy).

### Cases without confounding medical history (n = 201)

Of the remaining 347 cases, there were 201 cases did not have a confounding medical history. Ten of these cases had a fatal outcome which are reviewed separately below.

Of the remaining 191 non-fatal cases, the majority (138) reported the relevant events on the same day or the day after vaccination; in 35 of these cases the relevant events were reported within 2 hours of vaccination. See further details on reported latency below:

- Day 0: 98 cases (35 cases within 2 hours)
- Day 1: 41 cases
- Day 2 -7: 37 cases
- >7 Days (8-21): 16 cases

Cases with a latency of up to 7 days were manually reviewed (n = 176).

Of the 176 cases (that were medically confirmed and with an event latency of 7 days or less and without confounding medical histories), 100 cases reported the dose number (1<sup>st</sup> versus 2<sup>nd</sup> dose): in 58 cases the relevant events occurred after the first dose, (in 1 of these cases it was reported that no similar reaction occurred after the 2<sup>nd</sup> dose). In 42 cases the relevant events occurred after the 2<sup>nd</sup> dose (in 7 of these cases it was stated that no relevant events had occurred after the 1<sup>st</sup> dose). In 1 case ( (b) (6) ) a relevant event was reported after both the 1<sup>st</sup> and 2<sup>nd</sup> vaccination dose. The case concerned an 81-year old male where an absence seizure was reported 36 hours after the 2<sup>nd</sup> dose; it was also reported that the patient had a tonic-clonic seizure 13 days after the 1<sup>st</sup> dose.

The most frequently reported relevant events (PTs) in these 176 cases were: Seizure (120), Febrile convulsion (30), Epilepsy (25), Syncope (22), Generalised tonic-clonic seizure / or clonic convulsion (22). Where provided (170 cases), age ranged from 16 to 107 years [16 years (3), 18-55 years (122), 56 – 75 (24), 76-107 (21)].

One hundred (100) of the 176 cases were considered to provide insufficient and/or inconclusive information (the majority of these cases did not report on medical history and/or concurrent medications) to permit a reasonable evaluation. In a further 48 cases, there were co-reported events and/or relevant ongoing medical history that were considered confounding and provided a more likely explanation for the onset of the relevant events (e.g. hyper- and hypoglycaemia, schizophrenia, reflux syncope, description of hypersensitivity type reaction, stress-related onset, previous stress-related convulsive event, hippocampal sclerosis, non-epileptic attack disorder, on anti-epileptic medication, subdural haemorrhage, COVID-19 infection, brain tumor, event unlikely to be seizure).

There were 27 cases remaining, with relevant events reported within a plausible latency window of 0 and 5 days (16 cases on the same day (10 within 2 hours of vaccination), 7 cases on day one, and 6 cases between 2 to 5 days after vaccination). Still, in some of these cases, medical history and/or concomitant medications were not reported.

Most frequent relevant PTs in these the 27 cases were Seizure (19), Headache (8), Febrile convulsion (5), Generalised tonic-clonic seizure, Epilepsy, Syncope, Dizziness (4 each), Hypotension (3), Circulatory collapse (2). If mentioned, most of the relevant events were of short duration (few seconds to minutes); one case described a febrile convulsion lasting 4 hours.

The cases with a more immediate onset (minutes up to 2 hours) tended to report vasovagal type of symptoms in association with the relevant events such as hypotension, fainting, loss of consciousness, circulatory collapse, and psychogenic seizure. A number of the cases with longer latency co-reported signs of vaccine reactivity such as fever, headache, chills, fatigue, muscle pain, arthralgia with the relevant events. Some cases reported about further diagnostic workup; except for 1 case no abnormal findings were identified. In a case (b) (6) of a patient with a symptomatic epileptic seizure 30 minutes after vaccination, an MRI of the brain and lumbar puncture showed encephalitis changes which were assessed by the reporter to be 'side effects of the vaccine'. However, based on the description of the clinical signs in the narrative ('rotational dizziness, difficulty reading texts, confused and then lowered into consciousness') it was unclear whether an actual seizure had occurred.

#### **Cases with confounding medical history (n = 146)**

There were 146 cases had underlying confounding medical conditions which could make seizures more likely to occur. Eighty-six (86) patients had a medical history of epilepsy or was on antiepileptic therapy (1), 23 patients had a history of seizure; another 37 patients reported other confounding medical history such as cerebrovascular accident, leukoencephalopathy, stroke, Trisomy/Down's syndrome, ischaemic attack, ischaemic stroke, dementia, vascular dementia, Huntington's disease, mixed anxiety and depressive disorder, bipolar disorder.

Twelve (12) of the 146 cases had a fatal outcome and were reviewed separately, see below.

The majority (106) of the remaining 134 cases reported the relevant events on the same day or the day after (in 31 of these cases the events occurred within 2 hours of vaccination). See further detail on reported latency below:

- Day 0: 68 cases (31 cases within 2 hours)
- Day 1: 38 cases
- Day 2 to 7: 21 cases
- >7 Days (8-21): 7 cases

Of the 134, 127 cases reported a latency within 7 days which were further manually reviewed.

Eighty-five (85) of the 127 cases reported the relevant the dose number (i.e. 1<sup>st</sup> versus 2<sup>nd</sup> dose); in 66 of these cases the relevant events occurred after the 1<sup>st</sup> dose (in 1 case it was reported that no similar reaction occurred after the 2<sup>nd</sup> dose). In 19 cases, relevant events

were reported after the 2<sup>nd</sup> dose (in 3 of these cases it was stated that no relevant events had occurred after the 1<sup>st</sup> dose). In 1 case ( (b) (6) ), the same events were reported both after the 1<sup>st</sup> and 2<sup>nd</sup> dose. A 43-year-old female patient (with ongoing epilepsy with 2-3 seizures per year) was reported with a generalized tonic-clonic seizure within 15 minutes of each vaccination, lasting 15 minutes.

The most frequently reported relevant PTs were: Seizure (76), Epilepsy (or status epilepticus) (63), Generalised tonic-clonic seizure (22), Tonic convulsion (3), Syncope (8). There was only 1 case reporting Febrile convulsion, though another 12 cases co-reported Pyrexia.

Where provided (123 cases), patient age ranged from 16 to 102 years [16 years (1), 18-55 years (61), 56-75 (33), 76-107 (28)].

Of the 127 cases, 47 cases provided insufficient information precluding further analysis and 32 were confounded/ provided a possible alternative explanation for the onset of the relevant events (discontinuation of anti-epilepsy medication, ongoing unbalanced epilepsy, brain abscess, drug-resistant intractable ongoing epilepsy, ongoing pneumonia, hypersensitivity reaction, stroke, hyperglycaemia, airway obstruction, hyponatraemia).

In 14 cases (of the 127) it was mentioned that ongoing epilepsy had been well controlled (no seizures in last 12 months, up to 15 years). In 7 of these cases, the onset of the relevant events occurred on the same day, in 5 of these cases within 2 hours of vaccination. In the remaining 6 cases, latency of the event was 1 day (4 cases), 2 days (2 cases) or 4 days.

In 15 cases (of the 127) it was described that the ongoing seizure was not well controlled and/or the patients had seizure events in the last 12 months. In all but 2 of these cases, the onset of the events occurred the same day, in 3 of them within 2 hours. Eight cases provided insufficient information or were considered to be further confounded (seizure the previous evening). Given that the ongoing epilepsy in these cases was not well controlled, a causal attributability of the events to the vaccine is uncertain. It is considered likely that anxiety and circumstances around the vaccination event, and in some cases fever, may represent relevant triggers for the onset of seizure events.

There were 48 cases remaining with the relevant events occurring in the selected risk window of 0 and 7 days of vaccination (26 cases of these on the same day and 14 within minutes up to 2 hours), 15 cases on day 1, and 7 cases within 2-7 days) and in the absence of other apparent additional confounding factors (other than their relevant medical history) having been reported.

The most frequently reported relevant PTs in these cases were Seizure (31), Epilepsy (16), Generalised tonic-clonic (12), Dizziness (6), Headache (4), Syncope (3).

The characteristics of the reported seizure events in the patients with medical history of epilepsy tended to be similar to those familiar for that patient, and where reported, these seizures tended to be of longer duration than those observed in the patients without confounded medical history.

### Fatal cases (n = 28 cases - 1 duplicate)

Overall, there were 27 fatal cases; 23 were reported by a medical health care professional and 4 were consumer reports. Age range of the fatal cases was 24 to 95 years (age was not reported in 1 case), and 22 patients were > 65 years of age. The reported latency was as follows: 0 days (5), 1 day (5), 2 days (3), 3 days (1), 4 days (2), 5 days (1) 9 to 27 days (9); in 1 case latency was unclear. Fifteen cases reported relevant confounding medical history (dementia (5), epilepsy, cerebral palsy and ischaemic stroke [2 each], seizure, metastases to central nervous system, vascular encephalopathy, cerebral haematoma, Huntington's disease, drug abuser, dementia/vascular dementia and (1 each).

Upon review, all but 3 cases provided a more likely alternative explanation as the potential cause of death (ongoing COVID-19 infection, ischaemic lesions due to respiratory arrest, heart failure, meningitis, cerebrovascular accident, 'ongoing intracranial process', acute renal failure, thyrotoxicosis, suspected hashish consumption), or were considered unlikely to be potentially attributable to the vaccine due to a latency of > 7 days, and/or provided insufficient information for analysis.

The remaining 3 fatal cases involved a 32-year-old and 2 elderly patients (82 and 90 years) and are summarized below. The relevant events occurred 2, 5 and 13 hours after vaccination respectively. One of the elderly patients had a history of stroke (4 years prior) and vascular encephalopathy.

**Case ID (b) (6)** : A 32-year-old male patient received the first dose of BNT162b2 on 12 Feb 2021. Medical history included thyroid hormone replacement therapy. The patient was found deceased in the bathroom by his wife 13 hours after vaccination. It was suspected that the patient may have had a seizure due to epilepsy or vomiting due to intoxication. Autopsy confirmed the cause of death was aspiration of stomach contents.

Company comment: Insufficient information regarding cause of aspiration.

**Case ID (b) (6)** (consumer report): On 08 Feb 2021 (14:30), an 82-year-old male received the 1st dose COVID-19 immunization. Medical history included heart valve replacement (2016) and he was on oxygen at night. The patient's concomitant medications were not reported. The patient had no other vaccines on the same day as the COVID vaccine. By 16:30, he had passed away. The patient waited 15 minutes after he got the shot and he felt OK. He went to eat shortly after. When he was leaving, he reached for seatbelt and was suddenly quiet. He looked as if he was electrocuted. He was nonresponsive, stiff and seizing. He threw up on the way to the hospital. The doctors performed CPR. He was intubated, vomited again, and then passed away. Awaiting autopsy outcome.

Company comment: Limited case information (limited medical history or concomitant medications, consumer report), oxygen requirement at night, elderly.

**Case ID (b) (6)** : A 90-year-old female patient received first dose of BNT162b2 intramuscular on 05 Jan 2021. Medical history included vascular encephalopathy from an

unknown date and unknown if ongoing, last stroke from Oct 2016. The patient's concomitant medications were not reported. Before vaccination the patient was 'inconspicuous', normal food ingestion. The patient experienced cerebral seizures on 05 Jan 2021. Five (5) hours after vaccination the patient developed seizure cerebral of unknown duration. The patient died on 05 Jan 2021. Death cause was reported as seizure cerebral. It was not reported if an autopsy was performed. The PEI (Paul Ehrlich Institute) assessed the causality between the event and the vaccine as unclassifiable.

Company comment: vascular encephalopathy ongoing, stroke, elderly patient, limited information.

### Observed to Expected Ratio

The Observed to Expected (O/E) Ratios for spontaneously reported convulsion, for a no-risk window (cumulative through 31 Mar 2021) was 0.045 (95% CI: 0.041, 0.049), and for a 21-day risk window (cumulative through 31 Mar 2021) was 0.1 (95% CI: 0.091, 0.108). The background rate per 100,000 person years for seizures/convulsions/seizure disorders (including febrile) was 82.90; cumulative observed cases were 549 (see Table 2 below).

**Table 2. Observed versus Expected Analyses for convulsion (through 31 Mar 2021)**

AESI	Background Rate per 100,000 Person Years (PY)	Observed Cases, Cumulative	Expected Cases, Cumulative, 21-Day Risk Window <sup>a</sup>	Expected Cases, Cumulative, No Risk Window <sup>b</sup>	Observed Cases, Interval	Expected Cases, Interval, 21-Day Risk Window <sup>c</sup>	Expected Cases, Interval, No Risk Window <sup>d</sup>

<sup>#</sup> Pfizer Internal Data Healthcare, specific PFE\_SE\_PNG

EB05 (through 11 Apr 2021) for seizure was 1.08, for febrile convulsion was 1.079, and for generalised tonic-clonic seizure was 1.011.

## 6. SUMMARY AND DISCUSSION

There were 303 relevant cases identified which were in the considered 7-day risk window, 176 without confounding medical history, and 127 cases (~40%) with confounding medical history (epilepsy, seizure, stroke or other conditions known to lower the seizure threshold). In 80% (245) of these cases, the latency of the relevant events occurred either the same day or the day after (with 63 of the cases occurring within a 2-hour window of vaccination). Upon individual case review, there were 27 cases (of the cases without relevant medical history)

without obvious confounders, and 48 of the cases with relevant confounding medical history. No relevant cases were identified from the clinical trials.

It is known that patients with ongoing epilepsy or history of seizure, and other neurological conditions affecting the brain, have a lower seizure threshold, and therefore are more likely to develop spontaneous seizure, often in response to specific (but often unknown) triggers including stress, anxiety, unaccustomed circumstances, or fever or significant pain. Aside of fever, systemic inflammatory conditions have also been implicated to lower the seizure threshold in experimental studies- conditions which are likely to arise post vaccination, especially in patients with more severe post vaccination reactivity such as fever, chills, severe headaches, arthralgia, pain, malaise, fatigue. Such reactions can begin within hours of the vaccination and last for 1 or 2 days in most cases. This time window is corresponding to the latency window in which most of the cases in this review were reported and it would be conceivable for seizures to be triggered in the context of severe post vaccine reactivity, especially in patients with ongoing relevant history.

The cases with a more immediate onset of the relevant events (within 2 hours of vaccination) were mostly co-reported with anxiety and/or vasovagal type of reactions and upon review it is considered that these events are less likely to be of a direct consequence of the vaccine itself, and more likely to be a result of anxiety or other psychogenic precipitant. Indeed, in some cases (of those without confounding medical history) it was not clear whether a true seizure had actually occurred. It would be expected that seizure events are more likely to occur in patients with relevant pre-existing conditions such as epilepsy.

Many of the cases with a latency of 0, 1, or 2 days for the seizure events co-reported other significant post vaccination reactivity events such as fever, chills, severe headaches, arthralgia, pain, malaise, or fatigue. It would therefore be conceivable that intense inflammatory processes stimulated by the vaccine may play a role in triggering the onset of seizure events, especially in patients with a lowered seizure threshold.

Of 185 cases where a dose number was reported for the event (124 cases after the 1<sup>st</sup> versus 61 cases after the 2<sup>nd</sup> dose), only 2 cases reported a reoccurrence of relevant events after the 2<sup>nd</sup> dose. In one case (an 82-year old patient with no information on medical history or comedication), the type of events and latency were quite different (Dose 1: tonic-clonic seizure on day 13 versus Dose 2: absence seizure on day 1) which is therefore not considered indicative of a positive rechallenge. In the other case (a 43-year old patient with ongoing epilepsy with 2-3 seizures/year), the same event (generalized tonic-clonic seizure) occurred at the same latency (within 15-20 minutes).

The observed versus expected ratio for spontaneously reported convulsion was below 1, i.e. number of observed cases (576) was less than expected.

## 7. CONCLUSION

Overall, whilst a reasonable temporal relationship may have been identified between vaccination and seizure, based on the available data to date (and in consideration of the total number of relevant identified cases, the quality of the cases, the observed versus expected ratio  $< 1$ , and no signal observed in the clinical studies), there is insufficient evidence to establish a causal association between the COVID-19 vaccine and convulsion. Continued monitoring of the safety topic is recommended.

## APPENDIX 3.5 SAFETY EVALUATION OF OPTIC NEURITIS

### 1. METHODOLOGY

Pfizer's safety database contains cases of adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality. The Pfizer safety database Argus was searched for all BNT162b2 vaccine spontaneous and literature reports and serious clinical trial reports received through 13 April 2021 using the following MedDRA version 23.1 search criteria: PT: Optic neuritis.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

### 2. RESULTS

A total of 27 cases were retrieved using the search criteria mentioned above. Gender was reported as female for 23 cases and males for 4 cases. Age ranged from 31 to 74 years of age (mean:45.7, median: 42, N: 26). Outcome: 13 recovering, 5 unknown, 8 not recovering, 1 fatal.

Time to onset varied from the same vaccination day to 27 days (mean: 7.6, median: 6 days, N: 23).

Medical history was reported for 18 cases, among the relevant medical history there are 4 cases reported multiple sclerosis and 1 optic neuritis, in addition 4 had autoimmune diseases (1 Ankylosing spondylitis and 3 Autoimmune thyroiditis) and 1 reported a basal cell carcinoma.

The following cases are indicating either a pre-existing cause or a different causality:

One case ( (b) (6) ) not reporting a medical history reported the symptoms as flared up optic neuritis.

One case ( (b) (6) ) reported right retrobulbar pain (neuritis retrobulbar) secondary to headache, another case ( (b) (6) ) reported pain on all eye movements of right eye as optic neuritis.

Two cases reported MRI consistent with multiple sclerosis ( (b) (6) ) and two additional subjects reported MRI positive for optic neuritis ( (b) (6) , (b) (6) ).

An additional case ( (b) (6) ) reported optic neuritis in the context of air embolism and respiratory distress event 7 days after Bilateral blepharoplasty.

One case ( (b) (6) ) with a medical history of Hashimoto's thyroiditis reported pain upon movement/bulb movement but MRI was normal.

Case (b) (6) reported optic neuritis after the first and the second dose (19 and 1 day after the 1<sup>st</sup> and 2<sup>nd</sup> dose respectively). MRI showed plaques suggestive of a multiple sclerosis.

An additional case ( (b) (6) ) reporting in the medical history blindness since 20 years in 1 eye, report optic neuritis 2 days after vaccination without additional information.

Overall 6 cases reported MRI results and among them 2 cases were suggestive of multiple sclerosis (one with optic neuritis in the medical history) indicating a time to onset pre vaccination, 2 cases reporting alteration compatible with optic neuritis (1 case reporting autoimmune thyroiditis and one reporting Ankylosing spondylitis) , 1 case reported a normal MRI and 1 case reported it as abnormal without any additional specification.

### 3. OBSERVED VERSUS EXPECTED ANALYSIS

The MAH conducted unadjusted observed to expected ratio (O/E) analyses for the 27 reported optic neuritis cases. The O/E ratio was below 1 for both the 21-day risk window and no risk window, indicating there was not an increased risk of optic neuritis among recipients of the BNT162b2 vaccine.

**Table 1. Observed versus Expected (O/E) Analysis of 27 Spontaneously Reported Optic Neuritis Cases through 13 April 2021**

	21-Day Risk Window (8,166,481 PY <sup>a</sup> )	No Risk Window (19,355,521 PY)
O/E ratio (95% CI)	0.059 (0.039, 0.086)	0.025 (0.016, 0.036)
Expected cases <sup>b</sup>	457.32	1,083.91

a. Person year (PY) estimates through 11 April 2021

b. Derived from 5.6/100,000 PY background rate from Pfizer Internal Data Healthcare, specific PFE\_SE\_PNG.

Expected case counts were derived using a background incidence rate of 5.6 per 100,000 person years<sup>1</sup>. Person years of exposure estimates were derived from publicly available information reported by countries where the BNT162b2 vaccine is authorized<sup>2</sup>. For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all 27 cases were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population. To date, the majority of exposure derives from the US.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

<sup>1</sup> Pfizer Internal Data Healthcare, specific PFE\_SE\_PNG.

<sup>2</sup> <https://ourworldindata.org/covid-vaccinations#daily-vaccination-rates> (accessed 13 April 2021).

#### 4. SUMMARY AND CONCLUSION

Considering the overall data with subjects that reported already multiple sclerosis as comorbidity where an event of optic neuritis is part of the disease; cases having an autoimmune disease as comorbidity where a possibility of an autoimmune optic neuritis may be reported with a higher incidence compared to subjects without an autoimmune disease ; the new cases where a MRI suggest an underlying multiple sclerosis previously undiagnosed (but not new as multiple lesion usually develop during few months/years); cases reporting it exclusively as pain in the retrobulbar area and the cases where no information are reported a new signal is not evidenced. The Observed versus expected analysis does not show an increase risk.

An estimated more than 200 million doses of Pfizer-BioNTech COVID 19 Vaccine were administered globally through 12 April 2021.

The ratio of observed to expected cases does not exceed 1 over either risk window.

Overall, given the totality of the available information, changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

#### APPENDIX 1

AER Number	Age	Sex	Medical History	Conmed	Events	Country	Time to onset	Outcome	Dose	Important Info
(b) (6)	31	FEMALE	Drug hypersensitivity		Optic neuritis, Vision blurred, Myelitis transverse, Multiple sclerosis	UNITED STATES	3	not recovered	1	MRI brain on 15Jan2021- White matter lesions (High, consistent with multiple sclerosis (MS)); lumbar puncture on 28Jan2021- Positive IgG bands (High, consistent with MS).

## APPENDIX 3.6 SAFETY EVALUATION OF CRANIAL NERVE PALSY

### 1. INTRODUCTION

Cranial nerve disorder refers to an impairment of one of the twelve cranial nerves. Cranial nerve palsy may affect a sensory nerve, causing pain or diminished sensation or the motor part of the nerve causing weakness or paralysis.

Some of the different types of cranial neuropathies include:

- **Bell's palsy:** when the facial nerve (seventh cranial nerve) is affected.
- **Microvascular cranial nerve palsy:** this condition affects the nerves in the eye. It is most common in people who have diabetes and in those who have high blood pressure.
- **Third nerve palsy:** when the third cranial nerve is affected (most common symptoms include diplopia, ptosis, enlarged pupil)
- **Fourth nerve palsy:** also called superior oblique palsy as affects the superior oblique muscle
- **Sixth nerve palsy:** also called abducens palsy.

The causes of cranial neuropathies are various and include poorly controlled diabetes or high blood pressure, head injuries, infections, strokes, and brain tumors, herpes zoster, neuro sarcoidosis, LES, vasculitis, thyroid disorders, aneurism, demyelinating diseases, collagen vascular diseases, intracranial hypertension, intracranial hypotension, subarachnoid hemorrhage, among others.

### 2. METHODOLOGY

Pfizer's safety database contains cases of adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality. The safety database was searched for: IIIrd nerve paralysis /paresis, IVth nerve paralysis /paresis, VIth nerve paralysis /paresis, IXth nerve paralysis /paresis, XI nerve paralysis /paresis, Cranial nerve disorder, Cranial nerve paralysis, Paresis cranial nerve cases reported up to the 20<sup>th</sup> April 2021.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.
- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.

- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

### 3. RESULTS

A total of 51 cases were retrieved using the search criteria mentioned above. There were 23 female and 26 males and gender was not reported for 2 cases.

Age ranged from 30 to 93 years (mean: 61.9, N: 47), there were 25 adults ( $\geq 18 < 65$ ) and 22 elderly ( $\geq 65$ ) and for 4 subjects age was not reported.

Outcome was reported as recovered/recovering for 16, not recovered at time of reporting for 27, unknown in 7 and fatal in 1 case. Most cases were reported from UK (11, 21.6%), US (11, 21.6%), and Italy (10, 19.9%).

A total of 48 cases were assessed as serious and 3 as non-serious. Time to onset ranged from 1 to 21 days (mean: 7.1, median: 6, N: 46). A total of 23 cases reported the event after the first dose with a time to onset ranging from 1 to 21 days (mean: 7.9, Median: 6 days, N: 21) and 12 after the second vaccine dose and reported a time to onset ranging from 1 to 21 days ( mean: 6.8, median: 3, N: 11).

Medical history was reported in 37 cases. relevant medical history is reported in detail in Table 1.

**Table 1: Relevant Medical History**

Medical history	Number of cases
Hypertension	13 (2 associated with diabetes)
diabetes	5
Multiple sclerosis	1
Polycitemia vera/coagulopathy	3
Neoplasm	2
VIth nerve paralysis	1
IIIrd nerve paralysis	1
Thyroid disorders	2
Transient ischemic attack, intracranial hemorrhage	3
Pulmonary embolism	2
total	33

\*: few cases may report more than 1 pathology as comorbidity

Most cases reported VIth nerve paralysis followed by IIIrd and IVth as shown in Table 2.

**Table 2: Number of cases by specific PTs**

PT reported	Number of cases
VIth nerve paralysis /paresis	20
IIIrd nerve paralysis /paresis	14
IVth nerve paralysis	6
Cranial nerve disorder/ Cranial nerve paralysis	9 (3 VII nerve paralysis)
Paresis cranial nerve	3
*Total	53

\*Total is higher of the number of cases because few cases reported more than one event

Cases that have an alternative plausible aetiology are discussed below:

One case ( (b) (6) ) reported the event in the context of vasculitis and pulmonary embolism.

One case ( (b) (6) ) report in the MRI lesion appearing inflammatory in nature found in the Pons at origin of Cranial Nerve 6 and was diagnosed as possible Multiple sclerosis.

One case ( (b) (6) ) reported the event as occipital and retro auricular neuralgia as flare of MS.

Three cases reported VII nerve palsy and will be analyzed with all bell's palsy cases ( (b) (6) , (b) (6) , (b) (6) ).

One case ( (b) (6) ) reported in the CT scan data suggestive of a semi-recent stroke.

One case ( (b) (6) ) reported idiopathic intracranial hypertension.

One case ( (b) (6) ) reported a possible transient ischemic attack.

One case ( (b) (6) ) 8 hours after vaccination developed Covid and the cranial nerve disorder developed in the context of Covid infection.

In addition, a total of 13 cases reported negative CT or MRI but 7 had a concomitant comorbidity that put the subject at increased risk to develop palsy (hypertension, neoplasm, thyroid issue, polycythemia vera).

Among 28 cases that did not report a diagnostic examination 13 had a concomitant comorbidity that represent a confounding factor as diabetes, hypertension, pre-existing VIth nerve paralysis, polycythemia vera, previous transient ischemic attack and thyroid issues. The other cases did not report sufficient information for a proper diagnosis.

One case ( (b) (6) ) reported a rechallenge, the summary of the case is reported below:  
 A 44-year-old female patient received BNT162B2, 1st dose on 24Jan2021 and 2nd dose via on 14Feb2021. Medical history included ongoing allergy and migraine. There were no concomitant medications. On 24Jan2021 vaccine was administered into the left arm and approximately 15

minutes later, a one-time 15-second-lasting tiny muscle twitching on the left side of her face near the nose occurred, which was reported as probably due to nervousness. Two days after, the patient experienced mild headache, vaccination site was red and painful and she felt sensation of mild stiffing, tingling of left half of the face till in the evening the patient noticed mild lips asymmetry. Three days later the subjects experience migraine and saw that tongue directed slightly to one side. Neurologist said that it was an incomplete left-sided paresis of facial nerve. Conclusion of the physician on 02Feb2021 was lesion of mild extinction for cranial nerve VII, XII a V (left side) as a follow-up to vaccination, which was slowly recovering and recommended vitamin therapy. Outcome of the events was recovering. The patient had the 2nd dose and the events recurred.

One case ( (b) (6) ) reported a fatal outcome, the summary of the case is reported below. A 49-year-old patient of an unspecified gender received bnt162b2 on 14Jan2021. The patient's medical history and concomitant medications were not reported. The patient experienced one day after vaccination left hemisoma hyposthenia and deviation of the oral rhyme. The diagnosis was right arteria carotide dissection and the subject was hospitalized in the Neurology Department. Angio CT (computerised tomogram) intracranial vessels and CT skull neck vessels were performed for thrombolysis. The patient presents worsening of the clinical picture. Interventional neuroradiology is contacted and after viewing the images he recommends centralization for possible thrombectomy. The outcome of events was reported as fatal on an unspecified date.

#### 4. CONCLUSION

A total of 53 cases reported a cranial nerve disorder. Three were referring to a VII nerve paresis/paralysis and will be discussed separately in another review. In the remaining 50 cases most had either an alternative diagnosis or underlying comorbidities that are confounding factors and the few remaining did not report sufficient information for a proper evaluation.

Overall, given the totality of the available information, and the context in which the event was presented, changes in the risk minimization measures or updates to the product information label are not warranted at this time. The benefit risk profile of the vaccine remains favorable. The topic will continue to be closely monitored.

## **Pfizer-BioNTech COVID-19 Vaccine**

### **Myocarditis and Pericarditis**

#### **Report Prepared by:**

#### **BioNTech-Pfizer**

The information contained in this document is proprietary and confidential. Any disclosure, reproduction, distribution, or other dissemination of this information outside of BioNTech and Pfizer, its Affiliates, its Licensees, or Regulatory Agencies is strictly prohibited. Except as may be otherwise agreed to in writing, by accepting or reviewing these materials, you agree to hold such information in confidence and not to disclose it to others (except where required by applicable law), nor to use it for unauthorized purposes.

## 1. INTRODUCTION

Myocarditis is an inflammation of the heart muscle that may present with chest pain, palpitations, arrhythmias and/or heart failure. It may occur in children and adults and is more common in young men than young women. An estimated global prevalence of myocarditis is 22 cases per 100,000 patients. Diagnostic work-up may include serum cardiac biomarkers such as troponins and creatine kinase, electrocardiogram, echocardiography, cardiovascular magnetic resonance imaging and endomyocardial biopsy (diagnostic gold standard). Etiologies can include infection (most commonly viral), autoimmune (e.g. sarcoid and systemic lupus erythematosus) and drugs or toxins. In 50% of cases, acute myocarditis resolves quickly within 2-4 weeks, however 25% may develop persistent cardiac dysfunction and 25% may deteriorate to end-stage dilated cardiomyopathy. Treatment is dependent on presentation and may be directed at a specific etiology, if determined, heart failure and arrhythmias, if present.<sup>123</sup>

Pericarditis is an inflammation of the pericardial sac that contains the heart and fixes it to the mediastinum. Males between 20-50 appear to be at highest risk for pericarditis. The incidence has been reported to be about 28 cases per 100,000 in an urban Italian area. Diagnosis of acute pericarditis is made if 2 of 4 clinical criteria are met: 1. Pericardial chest pain, 2. Pericardial rub on auscultation, 3. ECG changes, 4. Pericardial effusion. Etiologies can remain unknown in 40-85% of patients with pericarditis but may be microbial (most commonly viral > bacterial) or autoimmune (e.g. systemic lupus erythematosus, rheumatoid arthritis) or neoplastic. It can be self-limiting or complicated by pericardial effusion and constriction (tamponade). Treatment is directed at inflammation with colchicine or other NSAIDs, aspirin, corticosteroids and anakinra (IL-1 receptor antagonist). Recurrences occur in about 30% of patients.<sup>4</sup>

Myocarditis is not a common feature of COVID-19 but has been reported in case reports and case series. Ho et. al reviewed the literature for cases of myocarditis and found 51 patients: 12 with confirmed (by cardiac magnetic resonance imaging or endomyocardial biopsy) and 39 with possible (cardiac biomarkers, ECG and/or echocardiograms) myocarditis. Patients had a median age of 55 and 69% were male. In general, they presented with the range of symptoms seen in myocarditis of other etiologies. Mortality was 27%.<sup>5</sup>

## 2. METHODOLOGY

Pfizer's safety database contains adverse events reported spontaneously to Pfizer, cases reported by the health authorities, cases published in the medical literature, cases from Pfizer-sponsored marketing programs, non-interventional studies, and cases of serious adverse events reported from clinical studies regardless of causality.

The limitations of post-marketing adverse drug event reporting should be considered when interpreting these data:

- Reports are submitted voluntarily, and the magnitude of underreporting is unknown. Some of the factors that may influence whether an event is reported include: length of time since marketing, market share of the drug, publicity about a drug or an adverse

event, seriousness of the reaction, regulatory actions, awareness by health professionals and consumers of adverse drug event reporting, and litigation.

- Because many external factors influence whether or not an adverse event is reported, the spontaneous reporting system yields reporting proportions not incidence rates. As a result, it is generally not appropriate to make between-drug comparisons using these proportions; the spontaneous reporting system should be used for signal detection rather than hypothesis testing.
- In some reports, clinical information (such as medical history, validation of diagnosis, time from drug use to onset of illness, dose, and use of concomitant drugs) is missing or incomplete, and follow-up information may not be available.
- An accumulation of adverse event reports does not necessarily indicate that a particular adverse event was caused by the drug; rather, the event may be due to an underlying disease or some other factor(s) such as past medical history or concomitant medication.

The safety database was searched for spontaneous AE reports for Pfizer/BNT COVID-19 vaccine using the search criteria: PT Pericarditis, PT Myocarditis and PT Pericardial effusion, cumulative to 17 April 2021.

### **3. RESULTS**

#### **3.1. Unblinded clinical study data**

Unblinded clinical study data from C4591001 (data-lock 13 Mar 2021) was searched for cases of myocarditis and pericarditis. During the blinded placebo-controlled follow-up period, there was one report of myocarditis in the placebo group and one report of pericarditis in the BNT162b2 group, a 66 year old white male who had pericarditis 29 days after dose 2 of vaccine which was ongoing at the time of the data cut-off. It was assessed as not related to study intervention by the investigator.

#### **3.2. Post-authorization data**

The search identified 278 reports. Thirty-one (31) reports were coded with the PT Pericardial effusion (without Pericarditis or Myocarditis). One hundred four (104) reports were coded with the PT Pericarditis, one hundred twenty-seven (127) reports were coded with the PT Myocarditis and sixteen cases (16) contained both PTs Pericarditis and Myocarditis. At the time of this search the number of spontaneous AE reports in the safety database for BNT162b2 was 133,166.

##### **3.2.1. Pericardial effusion**

All but 2 of the 31 reports coded with the PT Pericardial effusion (without pericarditis or myocarditis) were reviewed and eliminated from further consideration because they did not contain enough clinical detail to understand the clinical scenario or they described a pericardial effusion most likely attributed to another disease process such as neoplasm, acute

myocardial infarction, stroke, pulmonary embolism, exacerbation of congestive heart failure, or multiple organ failure. There was one death among these 29 cases.

- (b) (6) : a 75 year old man in the US with a history of diabetes mellitus 2 on multiple medications including for diabetes, hypertension and hyperlipidemia received the vaccine on 03 Feb 2021 and 10 days later presented to the ED with fever, headache, and upset stomach. He had a negative COVID-19 nasal swab at that time and the doctor thought he may be having a delayed reaction to the vaccine. He improved and on 19 Feb had another fever. He returned to the ED on 21 Feb after vomiting and losing consciousness, had another negative nasal swab, and arrested and could not be resuscitated. Results of a CT scan that he was sent for prior to his arrest showed COVID-like pneumonia and pericardial effusion which was felt to be his cause of death. An autopsy was not performed.

### 3.2.2. Pericarditis

The remaining 2 cases ( (b) (6) and (b) (6) ) were considered with the cases of pericarditis as they noted pericardial effusions caused by a virus, therefore they are described with the pericarditis cases. A total of 106 reports described pericarditis, including these 2 cases. However, 13 of the reports have alternative explanations for potential pericarditis including current COVID-19, history of autoimmune condition, renal failure and histories of tuberculosis. One additional report contained no information describing pericarditis.

Of the remaining 92 reports, ages ranged from 17 to 88 (mean 51.6, median 49) and there were 49 males and 42 females. Country of origin were distributed as follows: US (22), France (19), Israel (14), UK (13), Spain (8), Italy (6), Norway (3), Netherlands (2) and 1 each from Sweden, Romania, Portugal, Japan and Canada. Forty-seven (47) of the cases occurred following dose 1 of the vaccine, 32 after dose 2 and 13 reports did not specify the dose of vaccine. Time from vaccination to pericarditis onset was specified in all but 8 reports:

- Same day as vaccination: 6
- Day after vaccination: 15
- 2 to 7 days after vaccination: 31
- 8 to 21 days after vaccination: 23
- 22 to 41 days after vaccination: 10

Outcomes of pericarditis for the remaining were as follows:

- Recovered/Recovered with sequelae: 12
- Recovering: 37
- Not recovered: 20

- Unknown: 22
- Death: 1
  - (b) (6) : 72-year-old woman in the UK with a medical history of high cholesterol, acute myeloid leukaemia, hypertension elevated body mass index, GERD with unreported concomitant medications except chemotherapy with ado-trastuzumab emtansine at an unspecified time. She had her first vaccination on 18 Feb 2021 and developed chest pain on 21 Feb. She was hospitalized and was COVID-19 negative and neutropenic. A CT of the chest showed bilateral atelectasis and pericardial effusion. On 25 Feb, she went into cardiac arrest twice and died on 26 Feb 2021 reportedly due to pericarditis. It was not reported if an autopsy was performed.

Fourteen of the 92 patients had a history of pericarditis prior to vaccination and 7 had a history of COVID-19; one reported having influenza in the previous month. Of the 92 cases of pericarditis, 24 reported having ECGs, 27 reported having echocardiograms and 15 reported having both. Fifteen reports described pericardial effusions or pericardiocentesis being performed. One case described pericarditis occurring after dose 1 and dose 2.

- (b) (6) : 42-year-old man in Israel with a medical history of hypertension, dyslipidemia, smoking and tooth extraction (received antibiotics) at an unspecified time. The patient was reported to have perimyocarditis at an unspecified time after dose 1 and pericarditis after dose 2. The outcome was unknown, and no further details were provided.

### 3.2.2.1. Pericarditis – cases reported from Israel

Of the 14/92 cases of pericarditis reported from Israel, the ages ranged from 17 to 70 years (mean 37.0, median 32) and there were 12 males and 2 females. Five cases occurred after dose 1 and 9 occurred after dose 2. Seven cases occurred from 1 to 7 days following vaccination. One patient had a history of pericarditis, one with prostate and bladder cancer and one with a history of aortic valve replacement.

### 3.2.3. Myocarditis

One hundred twenty-seven (127) cases reported myocarditis. Of these reports, 16 had alternative explanations for myocarditis including current COVID-19, autoimmune disease and acute coronary syndromes. Two reports contained insufficient information about the reported event of myocarditis and 1 case was reported for a 4-month-old in the UK and was suspicious for an inaccurate report

Of the remaining 108 reports, ages ranged from 16 to 81 (mean 30.8, median 27) and there were 82 males and 25 females. Reporting countries were Israel (54), US (11), UK (9), Germany (9), France (5), , Italy (5), Sweden (4) Spain (2), Japan (2) and 1 each from Portugal, Poland, Greece, Finland, Denmark, Czech Republic and Canada. Eighteen (18) of the cases occurred following dose 1 of the vaccine, 75 after dose 2 and 15 reports did not

specify the dose of vaccine. Time from vaccination to myocarditis onset was not specified in 30 reports; the remaining times to onset were:

- Same day as vaccination: 14
- Day after vaccination: 16
- 2 to 7 days after vaccination: 40
- 8 to 21 days after vaccination: 7
- 27 days after vaccination: 1

Outcomes for the remaining were as follows:

- Recovered/Recovered with sequelae: 12
- Recovering: 14
- Not recovered: 18
- Unknown: 62
- Death: 2
  - (b) (6) : 47-year-old man in Israel with a medical history of diabetes (with target organ damage), hypertension, high cholesterol and hypothyroidism received his first dose of vaccine on an unspecified date. He presented to the ED with fever for 3 days, cough and difficulty breathing when laying down. He was anesthetized and resuscitated due to his rapidly deteriorating condition. He was diagnosed with myocarditis and died due to the condition at an unspecified time. It was not reported if an autopsy was performed.
  - (b) (6) : 19-year-old man in Israel with no underlying medical conditions. At an unspecified time following his second dose of the vaccine, he had an accelerated heartbeat and shortness of breath along with sharp pain radiating down his left arm. Labs revealed cardiac inflammation and he was diagnosed with myocarditis. He died 5 days following the 2<sup>nd</sup> dose. It was not known if an autopsy was done.

Three of the 108 patients had a history of myocarditis or myopericarditis prior to vaccination and 8 had a history of COVID-19. Of the 108 cases, 61 did not describe the use of cardiac biomarkers or diagnostic imaging studies. The remaining 47 cases had varying combinations of inflammatory biomarkers (e.g. C-reactive protein), cardiac biomarkers (e.g. Troponin), imaging studies (e.g. ECGs, echocardiograms, angiograms, cardiac magnetic resonance imaging). None of the reports described the gold-standard for diagnosis: endomyocardial biopsy for histology.

### 3.2.3.1. Myocarditis - cases reported from Israel

Of the 54/108 cases of myocarditis reported from Israel, the ages ranged from 16 to 56 years (mean 25.3, median 22.5) and there were 50 males and 4 females. Seven cases occurred after dose 1 and 44 occurred after dose 2 (3 unspecified). Four cases occurred on the same day as vaccination, 21 occurred from 1 to 5 days following vaccination. One 21-year-old patient had a history of myocarditis at the age of 14, and a 37-year-old patient had a history of perimyocarditis in the past due to streptococcal infections and responds well to colchicine. His last episode was 7 years ago. The majority of the 54 cases did not provide lab or imaging study detail and most outcomes (51) were unknown.

### 3.2.4. Both Pericarditis and Myocarditis

There were 16 reports that coded both myocarditis and pericarditis. For these cases, ages ranged from 17 to 81 (mean 31.2, median 25) and there were 12 males and 4 females. Reporting countries were Israel (12), France (2) and Austria and Germany (1 each). Eight (8) of the cases occurred following dose 1 of the vaccine, 4 after dose 2 and 4 reports did not specify the dose of vaccine. Time from vaccination to myocarditis onset was not specified in 3 reports; the remaining times to onset were:

- Day after vaccination: 2
- 2 to 7 days after vaccination: 9
- 8 to 21 days after vaccination: 2

Outcomes for the cases were as follows:

- Recovered 4
- Recovering: 6
- Not recovered: 1
- Unknown: 4
- Death: 1
  - (b) (6): 81-year-old woman in Austria with a medical history of COVID-19 (Dec 2020), meningioma, stroke with residual hemiparesis, hypertension and diabetes; concomitant medications were not reported. Two days prior to vaccination she developed a cough and cold, but her lungs were clear to auscultation on the day of vaccination. Three days following vaccination she had septic shock and multiple organ failure as well as extensive myocarditis and pericarditis with lactate and inflammation labs increased. She died 2 days later despite hemofiltration. The reporter did not think the vaccine caused the patient's death "but may have intensified the course." An autopsy confirmed pericarditis and myocarditis.

One of the 16 patients had a history of 3 episodes of pericarditis, one caused by EBV. This patient and 2 others had histories of COVID-19. Of the 16 cases, 2 described elevated troponins and 2 described cardiac MRIs showing myocarditis and pericarditis; a third case described an echocardiogram that showed pericarditis and effusion.

#### **3.2.4.1. Both Pericarditis and Myocarditis – cases reported from Israel**

Of the 16 reports coding both myocarditis and pericarditis, 12 were reported from Israel. Ages ranged from 17 to 48 years (mean 27.4, median 25) and there were 11 males and 1 female. Six cases occurred after dose 1 and 3 occurred after dose 2 (3 unspecified). Eight cases occurred from 1 to 3 days following vaccination, 1 occurred at 10 days and 3 were unspecified. None of the 12 patients described a history of myocarditis or pericarditis and none provided cardiac biomarkers or cardiac imaging studies. Eight of the patients tested negative for acute COVID-19 and 6 were diagnosed with concomitant multisystem inflammatory syndrome – adult (MIS-A). Outcomes were recovered (4), recovering (4) and unknown (4).

#### **3.2.5. Applying a standard definition to cases of myocarditis**

A recent publication by Bonaca et al.<sup>6</sup> proposed a case definition for myocarditis. The publication focused on patients receiving oncologic therapies, however the information on myocarditis and approach to diagnosis is aligned with current myocarditis literature and guidance.

With the exclusion of all other diagnosis/explanations (e.g. acute coronary syndrome) for myocarditis, the group defined 3 levels of certainty to be used in clinical studies.

- **Definite myocarditis:**

1. Tissue pathology **OR**
2. Diagnostic cardiac magnetic resonance imaging (CMR) + clinical syndrome + elevated biomarker or ECG evidence, **OR**
3. New wall motion abnormality on echocardiogram + Clinical syndrome + elevated biomarker + ECG evidence + Negative angiography

- **Probable myocarditis:**

1. Diagnostic CMR without any of the following: clinical syndrome, elevated biomarker or ECG evidence **OR**
2. Suggestive CMR with at least one of the following: clinical syndrome, elevated biomarker or ECG evidence **OR**
3. New wall motion abnormality on echocardiogram and clinical syndrome and 1 of the following: elevated biomarker or ECG evidence **OR**

4. Possible myocarditis with PET scan evidence and no alternative diagnosis

• **Possible myocarditis:**

1. Suggestive CMR without any of the following: clinical syndrome, elevated biomarker or ECG evidence OR
2. New wall motion abnormality on echocardiogram and one of the following: clinical syndrome, ECG evidence OR
3. Elevated biomarker and one of the following: clinical syndrome, ECG evidence

The above definitions were applied to the spontaneous cases of myocarditis (108) and both myocarditis and pericarditis cases (16). Of these 124 cases, 21 cases met the definition of possible myocarditis, 10 met the definition of probable myocarditis and 8 met the definition of definite myocarditis.

Cases of definite myocarditis consisted of 5 males and 3 females ages 19 to 81 (mean 34.4, median 28.5). Most myocarditis (6 cases) occurred following dose 2 of vaccine. The most common time to onset interval was 1 to 7 days (6 cases).

Cases of probable myocarditis consisted of 4 males and 6 females ages 12 to 81 (mean 38.6, median 35). Most cases (5) occurred after dose 1 of vaccine and the most common time to onset interval was tied between the same day (4 cases) and 1 to 7 days (4 cases).

Cases of possible myocarditis consisted of 11 males, 9 females and 2 patients of unspecified sex. Ages ranged from 16 to 56 (mean 34.5, median 32) and most cases occurred after dose 2 (14). The most common time to onset interval was 1 to 7 days (15 cases).

**Table 1. Eight Cases of Definite Myocarditis (Bonaca Criteria)**

AER Country Age/Sex	Certainty Dose	Findings
(b) (6) France 19 year/Male	Definite 2	Chest pain, Elevated troponin, Cardiac MRI: subepicardial edema in lateral wall, Echo: effusion
(b) (6) Italy 26/Male	Definite 2	Chest pain, Elevated troponin, CMRI: edema and acute myocardial changes, Echo: lower IVS hypokinesia
(b) (6) Spain 29/Male	Definite Unspecified	Chest pain, Echo: inferior hypokinesia, CMRI: compatible with acute myocarditis; Angiogram: normal
(b) (6) Italy 24/Male	Definite 2	Chest pain, ECG: arrhythmia, CMRI: acute myocarditis, Angiogram: normal
(b) (6) Denmark 31/Male	Definite 2	Chest pressure, Elevated troponin, CMRI: perimyocarditis

**Table 1. Eight Cases of Definite Myocarditis (Bonaca Criteria)**

AER Country Age/Sex	Certainty Dose	Findings
(b) (6) UK 37/Female	Definite 2	Chest pain, Elevated troponin, ECG: T wave abnormalities; CMRI: edema, subepicardial abnormalities, Angiogram: normal
(b) (6) Austria 81/Female	Definite 2	Diagnosis on tissue pathology (autopsy)
(b) (6) France 28/Female	Definite 1	Chest pain, Positive troponin, CMRI: Edema of left ventricular myocardium

**Table 2. Ten Cases of Probable Myocarditis (Bonaca Criteria)**

AER Country Age/Sex	Certainty Dose	Findings
(b) (6) Sweden 47/Female	Probable Unspecified	Chest pain, CMRI: revealed myocarditis
(b) (6) UK 35/Female	Probable Unspecified	Elevated troponin, CMRI: diagnostic of myocarditis; Angiogram: normal
(b) (6) Italy 21/Male	Probable 2	Elevated troponin, CMRI: suggestive of myocarditis
(b) (6) US 43/Male	Probable 1	Arm pain, CMRI: resulted in diagnosis of myocarditis, Angiogram: resulted in diagnosis of myocarditis
(b) (6) France 81/Female	Probable 2	Chest pain, Elevated troponin, Echo: favored myocarditis, Angiogram: normal
(b) (6) Israel 21/Male	Probable 2	Chest pain, Elevated troponin, ECG changes, Echo: decreased ejection fraction
(b) (6) UK 35/Female	Probable 1	Dizziness, tachycardia; Telemetry (ECG): normal, Echo: normal; CMRI: myocarditis
(b) (6) France 53/Male	Probable 1	Chest pressure, Echo: consistent with myopericarditis, CMRI: consistent with myopericarditis
(b) (6) UK 25/Female	Probable 1	Congestive heart failure symptoms, Elevated troponin, Echo: effusion and decreased ejection fraction
(b) (6) France 25/Female	Probable 1	Chest pain, Elevated troponin, CMRI: Pericarditis with or without myocarditis, ECG: normal, Echo: normal

**Table 3. Twenty-one Cases of Possible Myocarditis (Bonaca Criteria)**

AER Country Age/Sex	Certainty Dose	Findings
(b) (6) Germany 27/Male	Possible 2	Chest tightness, Elevated CK and troponin, CMRI: normal
(b) (6) UK 32/Female	Possible 2	Chest pain, Elevated troponin, ECG: ST elevations
(b) (6) Israel 16/Male	Possible 2	Chest pain, ECG: "bad"
(b) (6) Sweden 32/Male	Possible Unspecified	Chest pain, Elevated troponin, Echo and Angiogram: unremarkable
(b) (6) Canada 35/Female	Possible 1	Palpitations, effort intolerance; Elevated troponin, ECG: Tachycardia, Echo and Angiogram: normal
(b) (6) US 46/Female	Possible 1	Congestive heart failure symptoms, Echo: decreased ejection fraction
(b) (6) Sweden 54/Female	Possible Unspecified	Chest pain, Elevated troponin, ECG: ST elevation, Echo: normal
(b) (6) US 30/Male	Possible 2	Chest pain and shortness of breath, Elevated troponin, ECG: J-point elevation; Angiogram: normal
(b) (6) UK 56/Female	Possible 2	Chest pain, Elevated troponin, ECG: abnormal, Angiogram: showed effusion
(b) (6) Japan 27/Male	Possible 2	Chest pain, Elevated cardiac biomarker, ECG: abnormal, CMRI: performed but results not provided
(b) (6) Italy 29/Male	Possible 2	Chest pain, Elevated troponin
(b) (6) US 35/Female	Possible 2	Chest pain, shortness of breath, Elevated troponin, ECG and Echo: results unknown
(b) (6) US 43/Male	Possible 2	Chest pain, Elevated troponin, Angiogram: results not provided
(b) (6) UK 50/Female	Possible 1	Shortness of breath on exertion, Elevated troponin, ECG and Echo: results not provided
(b) (6) Germany 34/Female	Possible 1	Chest pain, Elevated troponin
(b) (6) Israel 19/Male	Possible 2	Chest pain, Elevated troponin, ECG: Sinus tachycardia

**Table 3. Twenty-one Cases of Possible Myocarditis (Bonaca Criteria)**

AER Country Age/Sex	Certainty Dose	Findings
(b) (6) Israel 24/Male	Possible 2	Chest pain, Elevated troponin
(b) (6) Czech Republic 38/Male	Possible 2	Burning chest pain, shortness of breath with activity; Elevated troponin
(b) (6) US 44/Female	Possible Unspecified	Chest pain, Elevated troponin
(b) (6) Japan 25/Male	Possible 2	Chest pain, Elevated troponin, ECG: ST elevation
(b) (6) Poland 28/Unspecified	Possible 2	Dyspnea, Tachycardia; Elevated cardiac biomarker

**4. EPIDEMIOLOGY**

The MAH conducted age-stratified observed to expected ratio (O/E) analyses for myocarditis and pericarditis for the summary monthly safety report.

**Table 4. Age-Stratified Observed to Expected (O/E) Ratios of Myocarditis and Pericarditis**

Age group	21-Day Risk Window		No Risk Window	
	O/E Ratio	95% CI	O/E Ratio	95% CI
<b>Myocarditis</b>				
18-64 years	0.607	0.514, 0.712	0.226	0.191, 0.265
65+ years	0.024	0.009, 0.052	0.009	0.003, 0.020
<b>Pericarditis</b>				
18-64 years	0.098	0.080, 0.119	0.037	0.030, 0.044
65+ years	0.045	0.033, 0.060	0.017	0.012, 0.022

**Table 5. Age-Stratified Observed versus Expected Analyses of Myocarditis and Pericarditis Inputs**

Age group	Background Rate per 100,000 Person Years (PY) <sup>7</sup>	Observed Cases <sup>a</sup>	Expected Cases, 21-Day Risk Window <sup>b</sup>	Expected Cases, No Risk Window <sup>c</sup>
<b>Myocarditis</b>				
18-64 years	4.40	151	248.87	669.15
65+ years	4.40	6	248.87	669.15

**Table 5. Age-Stratified Observed versus Expected Analyses of Myocarditis and Pericarditis Inputs**

Age group	Background Rate per 100,000 Person Years (PY) <sup>7</sup>	Observed Cases <sup>a</sup>	Expected Cases, 21-Day Risk Window <sup>b</sup>	Expected Cases, No Risk Window <sup>c</sup>
<b>Pericarditis</b>				
18-64 years	18.00	100	1,018.10	2,737.42
65+ years	18.00	46	1,018.10	2,737.42

- a. Through 29 April 2021
- b. 5,656,092 PY for both 18-64 years and 65+ years age groups through 30 April 2021
- c. 15,207,879 PY for both 18-64 years and 65+ years age groups through 30 April 2021

Observed case counts were identified using the PT codes myocarditis and pericarditis. Cases with age <18 years (n=5) were included in the 18-64 years age group, and cases with unknown age (n=22) were proportionally allocated to the 18-65 years and 65+ years age groups. Expected case counts were derived using a background incidence rate of 4.40 per 100,000 person years for myocarditis and 18.00 per 100,000 person years for pericarditis<sup>7</sup>. The same background rate was used for the 18-64 years and 65+ years age groups as the age-specific rates were not markedly variable in adults, though rates were higher in children. Person years of exposure estimates were derived from publicly available information reported by countries where the BNT162b2 vaccine is authorized<sup>8</sup>. For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report. Person years of exposure were assumed to be equally divided between the 18-64 years and 65+ years age groups, based on limited publicly available information on age distribution.

O/E ratios were calculated using a 21-day risk window and no risk window. However, the 21-day risk window was not applied to the observed case count; all cases of myocarditis and pericarditis were included in the numerator regardless of the duration between vaccination and event onset date.

Several limitations of the observed to expected comparison must be noted. With respect to observed cases, case ascertainment through the spontaneous reports likely reflect an underreporting due to incomplete reporting or a lag in reporting. Additionally, spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to the vaccine are more likely to be reported despite not meeting the clinical definition. Conversely, events that have not been previously associated with a vaccine are likely to be underreported.

With respect to the expected case counts, estimates concerning both exposure to vaccine and the background rate have limitations. Our exposure estimate assumes that the number of reported administrations is complete and accurate when in fact not all countries administering vaccine have reported counts of vaccine administration to the data source. Thus, the exposure may be underestimated. Our exposure estimate also assumes that 50% of vaccinees

were in the 18-64 years age group and 50% in the 65+ years age group, so the exposure may be under or overestimated in each age group.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate, and the same across age groups. However, it is possible that the delivery of health care, population demographics, and underlying health status of the population used for the background rate estimate differ from those expected in the vaccinated population and across age groups. To date, most of exposure derives from the US.

A further limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

## 5. SUMMARY AND CONCLUSION

Pericarditis and myocarditis have been reported following vaccination with Pfizer/BNT COVID-19 Vaccine. A mechanism of causality is not evident, however, a systemic inflammatory reaction due to an immune response to the vaccine could be postulated. Fewer cases of pericarditis than myocarditis have been reported. A large proportion of the myocarditis reports (54/108, 50%) and the myocarditis + pericarditis reports (12/16, 75%) are from Israel and of a similar patient profile (young and male); this influences the aggregate picture of the cases of myocarditis toward a younger and more male profile. Unfortunately, most cases from Israel do not provide diagnostic or outcome details; follow-up is ongoing.

Application of a case definition of myocarditis resulted in 39 of the 124 cases (31.5%) being categorized as having some degree of certainty in diagnosis (possible > probable > definite). Considering the totality of the available data, including post-authorization reports, clinical trial experience and the O/E epidemiology analyses, a causal association between the vaccine and myocarditis and pericarditis is not supported at this time. However, surveillance will continue and further details on the Israel cases, through spontaneous reporting or via any future publications will be thoroughly reviewed.

## APPENDIX 3.8 SUMMARY OF CASES OF THROMBOEMBOLISM WITH THROMBOCYTOPENIA

In an effort to be vigilant for any reported cases that may indicate the co-occurrence of thromboses and thrombocytopenia similar to what has been rarely described coincident with vaccination by adeno-vector COVID-19 vaccines, the Pfizer safety database was searched for all spontaneous reports of BNT162b2 cumulative to 22 April 2021 using MedDRA (v 23.1) for cases within the SMQ Embolic and thrombotic events where the thrombosis/embolic PT occurred from Day 3 to Day 28 (inclusive) following vaccination with BNT162b2. That dataset was then searched for PTs that are in either the HLT Thrombocytopenias or HLT Platelet analysis.

The final dataset is comprised of 33 AE reports in the safety database for BNT162b2 as of 22 April 2021.

All cases were individually reviewed and separated into 5 categories:

1. Cases not relevant to the topic concurrent thrombosis/embolism and thrombocytopenia (9)
  - These AE reports lacked description of either thrombocytopenia or a thrombotic event and therefore are not relevant to the topic of current interest.
2. Cases with alternative explanations for the events of interest (8)
  - These AE reports described patients with other conditions such as cancer, DIC and congenital abnormalities that are more likely explanations for their adverse events than a vaccination-induced process.
3. Cases containing insufficient information (2)  
and
4. Cases of Thrombotic thrombocytopenic purpura (2)
  - These 4 AE reports lacked detail supporting the presence of thrombocytopenia and/or thromboembolic events or report on the specific condition of TTP which is distinct from the topic of current interest.
5. Remaining cases (12)
  - These AE reports describe patients of varying genders, ages, and thromboembolic events (e.g. arterial, venous, common, and less common locations). Many of them have reported risk factors for thromboembolic

events (both venous and arterial). Not all reports provide labs or studies supporting the diagnosis of thrombocytopenia, and varying severity of thrombocytopenia is described. The heterogeneity of the cases does not suggest a common trend; however, surveillance will continue for cases of co-reported thrombocytopenia and thromboembolic events.

This review of cases of thrombosis with thrombocytopenia does not indicate the presence of a causal association with the Pfizer/BNT COVID-19 Vaccine.

**Table 1. Cases Not Relevant to the Topic Concurrent Thrombosis/Embolism and Thrombocytopenia**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
1	(b) (6) United States 56 years/Male 05 January 2021  Fatal case	Cerebral haemorrhage, Immune thrombocytopenia, Haemorrhage intracranial, Haemorrhagic stroke, Petechiae	1  3 days after D1	Pt with PMH of hypertension on no medications presented with petechiae and was admitted for thrombocytopenia (PC 0) which was refractory to multiple treatments. Pt died of intracerebral hemorrhage 16 days after D1. There was no report of thrombosis or embolism.
2	(b) (6) United States 39 years/Female 21 Jan 2021 Thrombocytopenia (Recovered) Cerebral hemorrhage (Not recovered)	Thrombocytopenia, Cerebrovascular accident, Cerebral haemorrhage, Brain injury, Memory impairment	1  12 days	Pt with unreported PMH presented with cerebral hemorrhage and thrombocytopenia (PC 36). Thrombocytopenia recovered following a platelet and blood transfusion. Rehab was started for the cerebral hemorrhage. There was no report of thrombosis or embolism.
3	(b) (6) United States 68 years/Female 28 February 2021  Not recovered	Pain, Back pain, Arthralgia, Gait disturbance, Musculoskeletal stiffness, Heparin-induced thrombocytopenia, Respiratory disorder, Chronic obstructive pulmonary disease, Fatigue, Headache, Nausea, White blood cell count increased, Red blood cell count abnormal, Neutrophil count abnormal, Monocyte count abnormal, Basophil count abnormal, Platelet	2  5 days after D2 back pain worsened	Upon review of the case details, it was determined the case was miscoded with PT Heparin-induced thrombocytopenia; the case is being corrected.

**Table 1. Cases Not Relevant to the Topic Concurrent Thrombosis/Embolism and Thrombocytopenia**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
		disorder, Musculoskeletal stiffness, Neck pain, Pain in jaw, Ear pain, Diarrhoea		
4	(b) (6) United States 46 years/Female 17 March 2021  Recovering	Pyrexia, Cough, Myalgia, Peripheral swelling, Cardiogenic shock, Myocarditis, Respiratory failure, Thrombosis, Blood pressure decreased, Thrombocytopenia, Haemorrhage	1  14 days	Pt with PMH of COVID-19 pneumonia (Jan 2021) presented with symptoms of myocarditis and heart failure. On echocardiogram, her cardiac ejection fraction was 35% and an intracardiac mural thrombus was visualized. She was hospitalized for 20 days and during that time had thrombocytopenia (PC not reported)
5	(b) (6) United Kingdom 82 years/Female 27 March 2021  CVST (Recovered with sequelae)	Headache, Cerebral haemorrhage, Thrombosis, Seizure, Muscular weakness, Generalised tonic-clonic seizure, Superior sagittal sinus thrombosis, Jugular vein thrombosis, Syncope, Pulmonary embolism, Thrombocytopenia	1  12 days after D1 had headache	Pt with PMH of thrombocytopenia, obesity, suspected COVID-19 and multiple bone fractures presented with headache. She was found to have a cerebral venous sinus thrombosis. Despite her PMH of thrombocytopenia, her PCs in the hospital were 271 and 305. She was not thrombocytopenic.
6	(b) (6) Netherlands 80 years/Male 01 April 2021  PE (Recovering) Platelet count decreased (Unknown)	Atrioventricular block complete, Pulmonary embolism (PE), Blood creatinine increased, Platelet count decreased, Renal disorder	1  3 days	Pt with PMH of PE and LBBB presented with dyspnea and dizziness and was found to have AV block. A cardiac pacemaker was placed. During his hospitalization he had a PE and a platelet count of 149.
7	(b) (6) Portugal 89 years/Female 12 April 2021  Recovering	Pulmonary embolism, Dyspnoea at rest, Platelet count increased, Fibrin D dimer increased	2  26 days	Pt with PMH of hypertension and asthma presented with dyspnea at rest. She was suspected of having a PE. Her D-dimer level was elevated, and her PC was 171. She did not have thrombocytopenia.
8	(b) (6) United Kingdom 58 years/Male 12 April 2021  Thrombosis (Not recovered)	Cerebral venous sinus thrombosis, Confusional state, Thrombosis, Loss of consciousness, Platelet count decreased	2  20 days	Pt with no PMH presented with confusion and collapse. A CT venogram showed cerebral venous sinus thrombosis. His D-dimer was >6000 and his PC was >150. He did not have thrombocytopenia
9	(b) (6) United States	Jaundice, Nausea, Vomiting, Diarrhoea,	1	Pt with PMH of metastatic breast cancer who received an oncologic

**Table 1. Cases Not Relevant to the Topic Concurrent Thrombosis/Embolism and Thrombocytopenia**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
	49 years/Female 14 April 2021  Fatal case	Microangiopathic haemolytic anaemia, Thrombocytopenia, Hyperbilirubinaemia, Cholestasis, Coagulopathy, Thrombotic microangiopathy	7 days	study drug (ARV-471) 7 days prior to D1 of vaccine presented 7 days after vaccination with 1 week of jaundice, nausea, vomiting and diarrhea. She was diagnosed with microangiopathic hemolytic anemia. A PC was not reported nor were details on any thrombi/emboli
PMH=past medical history, PC=platelet count, unit is PC x 10 <sup>9</sup> /L; D1=dose 1, D2=dose 2, CT=Computed tomography				

**Table 2. Cases with Alternative Explanations for the Events of Interest**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
1	(b) (6) United States 70 years/Female 21 March 2021  Fatal case	Red cell distribution width increased, Platelet count decreased, Neutrophil count decreased, Band neutrophil count increased, Monocyte count increased, Metamyelocyte count increased, Myelocyte count increased, Neutrophil count decreased, Blast cell count increased, Pain in extremity, Thrombosis, Leukaemia, Acute myeloid leukaemia, Haemorrhagic stroke, Ischaemic stroke, Cerebral haemorrhage, Disseminated intravascular coagulation	2  2 days	Pt with PMH of breast cancer had an abnormal CBC with metamyelocytes. She went on to have lower extremity venous thromboses and Disseminated intravascular coagulation. She was diagnosed with acute myeloid leukemia. A platelet count was not provided. The patient's hematologic cancer and, potentially, the breast cancer, are potential causes of the adverse events.
2	(b) (6) Austria 66 years/Male 26 March 2021	Pulmonary embolism, Syncope, Fibrin D dimer increased, Hypotension, Troponin T increased, Brain natriuretic peptide increased,	1  1 day	Patient with PMH of Parkinson's disease, breast cancer and obesity presented with syncope and was found to have abnormal blood tests. He also had B cell lymphoma as a potential alternative explanation for

**Table 2. Cases with Alternative Explanations for the Events of Interest**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
	Thrombocytopenia (Recovered) Pulmonary embolism (Recovering)	Thrombocytopenia, C-reactive protein increased, Blood creatine phosphokinase increased, Venous thrombosis limb		his PE and low platelet count (nadir 103). D-dimer was 33.
3	(b) (6) United Kingdom 55 years/Male 28 March 2021  Thrombosis and thrombocytopenia (Not recovered)	Respiratory failure, Thrombosis, Condition aggravated, Thrombocytopenia, Diarrhoea, Urinary tract infection, Dyspnoea, Haemodynamic instability, Pulmonary embolism, Neutrophilia, Sepsis	1  15 days	Patient with PMH of alcohol use, DVT, morbid obesity, respiratory failure, polyarthropathy, gout, psoriasis presented with severe shortness of breath. He was intubated and found to have a PE. His platelet nadir was 47, D-dimer elevated 25.4, Fibrinogen low 1.6 and anti-PF4 antibodies were negative. A hematologist familiar with vaccine-induced thrombocytopenia and thrombosis evaluated the patient and attributed the thrombosis to immobility and obesity and the thrombocytopenia to alcohol use and sepsis.
4	(b) (6) France 76 years/Female 29 March 2021  Pulmonary embolism (Recovering) Thrombocytopenia (Unknown)	Pulmonary embolism, Thrombocytopenia, Dyspnoea	2  19 days	Pt with PMH of lower extremity thromboses, obesity and breast cancer thought to be in remission as of Aug 2019 presented with shortness of breath. She was found to have a PE and platelet count of 135. D-dimer was >20,000. She was treated with low molecular weight heparin and improved. Improvement on heparin is not likely if a HIT-like processes is present.
5	(b) (6) France 54 years/Male 02 April 2021  Not recovered	Portal vein thrombosis, Condition aggravated, Thrombocytopenia	1  9 days	Pt with hepatocellular carcinoma due to hepatitis C and PMH of portal vein thrombosis since Oct 2020 was found on CT scan (04 Mar 2021) to have progression of the portal vein thrombosis. His platelet count was 116 then 84. The patient's adenocarcinoma is a potential cause of the events.
6	(b) (6) United Kingdom 55 years/Male 16 April 2021  Fatal case	Intestinal ischaemia, Mesenteric vein thrombosis, Hypotension, Abdominal pain, Tachycardia, Thrombocytopenia	1  27 days	Pt with a PMH of congenital malrotation of his gut and colon adenoma had worsening abdominal pain with eating. He had a hemicolectomy to remove the adenoma and post-operatively had worsened abdominal pain and hypotension. He had mesenteric vein thrombosis and intestinal ischemia. His PC was 35 post-op; it is unknown if D-dimer and anti-PF4 antibodies

**Table 2. Cases with Alternative Explanations for the Events of Interest**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
				were sent. He died and on autopsy was found to have thrombosis of an abnormal small bowel venous drainage system. The congenital abnormalities are a potential precipitant to thromboses as is the recent surgery.
7	(b) (6) France 72 year/Male 19 April 2021  Fatal case	Disseminated intravascular coagulation, Thrombosis, Thrombocytopenia	1  14 days	Pt with PMH of atrial fibrillation and hypertension was found down. He was found to have pancreatitis grade D and lab abnormalities including a PC of 34 and CPK>8000 and was thought to be in DIC. He had been anticoagulated with rivaroxaban but had intracardiac, aortic and arm and leg arterial thromboses.
8	(b) (6) Sweden 66 year/Male 21 April 2021  Not recovered	Pulmonary embolism, Thrombocytopenia	2  9 days	Pt with PMH of hypertension presented with back, abdominal and pleuritic chest pain. He was found to have enlarged lymph nodes in the right pulmonary hilus along with a PE. Anticoagulation with apixaban was started and 5 days later his PC was 36. HIT antibodies were reported to be negative and apixaban (thrombocytopenia is ADR in labeling) was stopped.
PMH=past medical history, CT=Computed tomography, PC=platelet count, unit is PC x 10 <sup>9</sup> /L; D1=dose 1, D2=dose 2, PF4=Platelet factor 4, CPK=Creatine phosphokinase, HIT=Heparin-induced thrombocytopenia, ADR=Adverse drug reaction				

**Table 3. Cases with Insufficient Information**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose  Time to onset</b>	<b>Additional information</b>
1	(b) (6) Spain 92 year/Female 22 March 2021  Fatal case	Thrombotic microangiopathy, Thrombotic thrombocytopenic purpura	1  13 days	Pt with PMH of hypertension, osteoarthritis and vertigo presented with unspecified symptoms and was diagnosed with a thrombotic microangiopathy of the TTP type. No labs were reported. No specific events of thromboembolism are described. She died 10 days after presentation, and it was not known if an autopsy was performed.

**Table 3. Cases with Insufficient Information**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose Time to onset</b>	<b>Additional information</b>
2	(b) (6) United Kingdom 58 years/Female 11 April 2021  Fatal case	Death, Sudden death, Embolism, Thrombocytopenia	2  8 days	Pt with a PMH of asthma, depression, dyspepsia on hormone replacement therapy died suddenly and the case was reported because it was potentially relevant to thrombosis and thrombocytopenia syndrome. No specifics in terms of thromboses or PC were provided.
PMH=past medical history, PC=platelet count, unit is PC x 10 <sup>9</sup> /L; D1=dose 1, D2=dose 2, TTP=Thrombotic thrombocytopenic purpura				

**Table 4. Cases of Thrombotic Thrombocytopenic Purpura**

	<b>AE Report number Country Age/Sex Initial receipt date Outcome</b>	<b>Preferred terms</b>	<b>Dose Time to onset</b>	<b>Additional information</b>
1	(b) (6) United Kingdom 34 years/Female 08 April 2021  TTP (Not recovered)	Platelet count decreased, Thrombotic thrombocytopenic purpura	1  28 days to TTP	Pt with PMH of multiple sclerosis and neuralgia was found to have low PC (not reported), hospitalized and diagnosed with TTP. She was COVID-19 negative. Sites of thromboses were not provided. The events occurred 28 days following vaccination.
2	(b) (6) United Kingdom 83 years/Female 12 April 2021  Recovering	Immune-mediated hepatic disorder, Haemorrhage, Activated partial thromboplastin time shortened, Thrombotic thrombocytopenic purpura, Neurological symptom	2  4 days	Pt with no reported PMH presented with 1 day of fluctuating neurological symptoms. She was found to have severe thrombocytopenia (PC nadir 9) and red blood cell fragmentation. ADAMTS protein level was <1% and she was diagnosed with TTP. No thrombotic events were described.
PMH=past medical history, PC=platelet count, unit is PC x 10 <sup>9</sup> /L; D1=dose 1, D2=dose 2, ADAMTS=A Disintegrin-like And Metalloproteinase with Thrombospondin				

**Table 5. Remaining Cases of Concurrent Thromboembolism and Thrombocytopenia**

	AE Report number Country Age/Sex Initial receipt date Outcome	Preferred terms	Dose Time to onset	Additional information
1	(b) (6) US 22/Female 12 Jan 2021 Thromboses: recovering Thrombocytopenia: recovering	Deep vein thrombosis, Pulmonary embolism, Thrombocytopenia, Thrombosis	2 3 days	The reporter was a nurse and the patient. She had a history of blood clots and food allergies presented with back pain and blue, swollen legs and was found to have bilateral DVTs and PE. At an unspecified time, she was diagnosed with thrombocytopenia. Platelet count was not reported. She was treated with IV heparin and then oral rivaroxaban at home. The lack of PC and treatment with heparin suggest this case is not consistent with the thrombotic thrombocytopenic syndrome of interest.
2	(b) (6) Italy 84/Male 24 Mar 2021 PE: Not recovered	Thrombocytopenia, Pleural effusion, Acute kidney injury, Transient ischaemic attack, Pulmonary embolism, Pericardial effusion, Mitral valve incompetence, Tricuspid valve incompetence, Pulmonary infarction, Left ventricular dysfunction, Aortic dilatation, Right ventricular dilatation	1 12 days	Pt with history of hypertension, carotid arteriosclerosis on aspirin and amlodipine presented with unspecified complaints and was found to have 2 TIAs, a PE, acute renal failure, thrombocytopenia, pericardial and pleural effusions. Platelet count was not reported. D-dimer was tested but results not provided. Unspecified anticoagulation therapy was given.  This patient has risk factors for an ischemic thromboembolic event such as stroke. A specific PC is not provided. Overall the events are not consistent with the thrombotic thrombocytopenic syndrome of interest.
3	(b) (6) UK 33/Male 04 Apr 2021 CVST: Recovered Immune thrombocytopenia: Not recovered	Platelet count decreased, Immune thrombocytopenia, Cerebral venous sinus thrombosis, Headache, Petechiae	Unspecified  Low platelets 1 day after vaccination; CVST 18 days after vaccination	The consumer was the reporter; he had no known medical history and was diagnosed with immune thrombocytopenia after presenting with low PC 1 day after vaccination (PC nadir: 19). At 18 days following vaccination, he presented with "possible CVST" and PC 22. No brain imaging study was provided, and the patient was not aware if PF4 antibodies were measured. The very close temporality between vaccination and low platelet count put biological plausibility in question.
4	(b) (6) Poland	Acute kidney injury, Acute myocardial	1	Pt with a history of coronary artery disease, hypertension and

**Table 5. Remaining Cases of Concurrent Thromboembolism and Thrombocytopenia**

	AE Report number Country Age/Sex Initial receipt date Outcome	Preferred terms	Dose Time to onset	Additional information
	73/Male 05 Apr 2021 Fatal report	infarction, Thrombocytopenia, Pancreatitis acute	9 days	degenerative joint disease taking ramipril and lercanidipine HCl presented with acute renal failure, a transmural MI, acute pancreatitis, and thrombocytopenia (PC nadir 131) and died the same day. It was noted that baseline COD was pancreatitis, secondary COD was acute renal failure and direct COD was MI. An autopsy was not performed. The course of events (multiorgan failure) described are more likely attributable to pancreatitis than a rarer syndrome of thrombotic thrombocytopenia.
5	(b) (6) UK 74/Male 08 Apr 2021 Platelet count decreased: Unknown CVA: Recovered	Head injury, Cerebrovascular accident, Platelet count decreased	1  CVA 4 days after vaccination; Platelet count decreased 6 days after vaccination	Pt with a history of ischemic stroke, diabetes and smoking and normal pre-vaccination PC (220) had a head injury on an unspecified date then a thalamic infarction seen on brain MRI and 2 days later, a platelet count of 130 (nadir). No hemorrhages occurred. No anti-PF4 antibodies were identified. The risk factors for ischemic stroke are the likely cause of the stroke and the mild thrombocytopenia is not consistent with the thrombotic thrombocytopenic syndrome of interest.
6	(b) (6) UK 85/Male 09 Apr 2021 Fatal report	Cerebrovascular accident, Platelet count decreased	1  7 days	Pt with a history of gastrointestinal bleed, atrial fibrillation taking digoxin, finasteride, furosemide, salbutamol, solifenacin and tamsulosin and rivaroxaban which was recently stopped due to a GI bleed. The patient presented with a middle cerebral artery stroke 7 days after vaccination and a platelet count less than 150 (not specified). The patient died due to the stroke 7 days after the stroke. The patient has known risk factors for ischemic stroke, and these are more likely its cause than a rarer syndrome of thrombotic thrombocytopenia. In addition, the PC is not provided so the severity of thrombocytopenia is not known
7	(b) (6) UK 47/Female	Haemorrhage, Thrombosis, Embolism, Arterial thrombosis,	1	Pt with a history of pulmonary embolism, thrombosis concomitant medications not reported. The patient

**Table 5. Remaining Cases of Concurrent Thromboembolism and Thrombocytopenia**

	AE Report number Country Age/Sex Initial receipt date Outcome	Preferred terms	Dose Time to onset	Additional information
	11 Apr 2021 Arterial and venous thromboses: Recovered Thrombocytopenia: Unknown	Venous thrombosis, Cerebral venous sinus thrombosis, Cerebral haemorrhage, Chest injury, Thrombocytopenia, Abdominal pain, Muscular weakness	Platelet count < 150, 9 days after vaccination; Thromboses, 12 days after vaccination	presented with abdominal pain and left-hand weakness. She was found to have arterial and venous thromboses (splanchnic, hepatic portal thromboses, PE and CVST). She experienced bleeding at the CVST location. Platelet count was 11 at presentation (nadir 10), Fibrinogen 4.4, D-dimer 20,000, Anti-PF4 antibodies were identified. A hematologist was reported to have reviewed the case and assessed as probable vaccine-associated thrombosis and thrombocytopenia
8	(b) (6) UK 91/Female 11 Apr 2021 Not recovered	Dyspnoea, Blood fibrinogen decreased, Pancytopenia, Deep vein thrombosis, Disseminated intravascular coagulation, Thrombocytopenia	2 9 days	Pt with a history of iron deficiency anemia, MGUS, Angioedema (C1 deficiency), probably sarcoidosis, Urinary tract infections taking iron, loperamide, nitrofurantoin, omeprazole, presented with dyspnea and weakness and was found to have pancytopenia (WBC 3.9, PC 71), bilateral lower extremity DVTs and DIC. She had low fibrinogen (0.6) and D-dimer elevated but <4000, COVID-19 test was negative and PF4 assay was pending at the time of the report. The elderly patient has baseline conditions predisposing to venous thromboses and although the platelet count is below normal the D-dimer makes the diagnosis of the syndrome of interest less likely.
9	(b) (6) Spain 84/Male 14 Apr 2021 Thrombocytopenia: Recovering Ischemic stroke: Recovered	Thrombocytopenia, Ischaemic stroke, Facial paralysis, Dysphagia	1 6 days	Pt with history of diabetes, hypertension, primary cognitive impairment, atrial fibrillation (on LMWH) presented 6 days after dose 1 of vaccine with dysphagia, left facial paralysis and ischemic stroke on MRI and MRI angiogram). He was found to be thrombocytopenic (PC nadir 56). No bleeding was described. It is not stated whether the LMWH was continued. The patient was discharged after 10 days in hospital. The use of LMWH to anticoagulate this patient with AF for an unspecified amount of time complicates assessment of its role and the potential role of vaccination in the presenting events.

**Table 5. Remaining Cases of Concurrent Thromboembolism and Thrombocytopenia**

	AE Report number Country Age/Sex Initial receipt date Outcome	Preferred terms	Dose Time to onset	Additional information
10	(b) (6) Norway 75/Male 15 Apr 2021 Fatal report	Pneumonia, Thrombocytopenia, Respiratory failure, Depressed level of consciousness, Hemiplegia, Cerebral thrombosis	2 20 days	PT with medical history of lung fibrosis, high cholesterol, prostate hyperplasia, and acid reflux taking atorvastatin, pirfenidone, finasteride, aspirin and esomeprazole presented with severe pneumonia 20 days after 2 <sup>nd</sup> vaccination. He was treated with antibiotics and 2 days later had a decrease in consciousness, hemiplegia and was found to have a platelet count that went from 120 to 60 in 2 days. COVID-19 test was negative. The patient was reported to have an intracerebral thrombosis although no imaging study was described. Intensive care was stopped on the day of the apparent stroke and the patient died. The presence of an infection such as severe pneumonia is an alternative explanation for the other adverse events reported in this vulnerable patient
11	(b) (6) Sweden 87/Female 15 Apr 2021 Not recovered	Thrombocytopenia, Pulmonary embolism	2 12 days	Pt with medical history of anemia, hypertension, diabetes, chronic kidney disease (medications not reported) presented with unspecified complaints and was found to have a PE and thrombocytopenia (PC initially 127 then 112). She was anticoagulated with argatroban and oxygen. This patient presents with a less severe thrombocytopenia and more common location of venous thrombosis than has been described in the cases of concern.
12	(b) (6) US 36/Male 15 Apr 2021 Not recovered	Mesenteric vein thrombosis, Sepsis, Thrombocytopenia, Escherichia bacteraemia, Eating disorder, Abdominal pain, Nausea, Vomiting, Myalgia, Chills, Pyrexia, Lethargy	1 5 days	Pt with medical history of diverticulitis, COVID-19 and on escitalopram presented with abdominal pain. A CT of the abdomen and pelvis was performed and the patient was treated for uncomplicated diverticulitis. Three days later he returned to the ED for worsening abdominal pain and was found to have an inferior mesenteric vein thrombus protruding into the superior mesenteric and portal veins. In retrospect, the thrombus (albeit smaller) was present at the time of the first CT scan. He was also reported to be bacteremic (E. coli)

**Table 5. Remaining Cases of Concurrent Thromboembolism and Thrombocytopenia**

	AE Report number Country Age/Sex Initial receipt date Outcome	Preferred terms	Dose  Time to onset	Additional information
				and thrombocytopenic (PC not reported). He was treated with IV heparin and reportedly improved however he was in the ICU at the time of the report. The reporter states that the diverticulosis could be an explanation for the clinical presentation. Further lab work and follow-up on the patient's assessment and course would be helpful.
PMH=past medical history, PE=pulmonary embolism, PC=platelet count, unit is $PC \times 10^9/L$ ; D1=dose 1, D2=dose 2; LMWH= low molecular weight heparin				

**APPENDIX 4. CUMULATIVE APPROVAL/AUTHORISATION STATUS**

Product Detail Set Name	Marketing Authorization Holder	Country	Approval Date	Authorization Type

Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	New Zealand	3-Feb-21	Conditional marketing authorization approval
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	Dominican Republic	8-Feb-21	EUA
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	Japan	14-Feb-21	Conditional marketing authorization approval
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	Ukraine	22-Feb-21	EUA
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	Brazil	23-Feb-21	Conditional marketing authorization approval
Pfizer-BioNTech COVID-19 mRNA vaccine	BioNTech	Macau	23-Feb-21	Special import permit

Pfizer-BioNTech COVID-19 mRNA vaccine	BioNTech	Albania	24-Feb-21	Conditional marketing authorization approval
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	Rwanda	1-Mar-21	EUA
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	South Korea	5-Mar-21	Conditional marketing authorization approval
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	South Africa	11-Mar-21	Special Import Permit - Section 21
Pfizer-BioNTech COVID-19 mRNA vaccine	Pfizer	Palestine	25-Mar-21	EUA
Pfizer-BioNTech COVID-19 mRNA vaccine	BioNTech	Algeria	12-Apr-21	EUA
Pfizer-BioNTech COVID-19 mRNA vaccine	BioNTech	United Kingdom	22-Apr-21	Conditional marketing authorization approval
Pfizer-BioNTech COVID-19 mRNA vaccine	BioNTech	Georgia	29-Apr-21	EUA

\* Compared to previous SMSRs, Authorization type in Malaysia updated to Conditional marketing authorization approval and Approval date updated to 29 January 2021 in the Philippines as per respective local Pfizer Country Offices confirmation

## APPENDIX 5. LIST OF ADVERSE EVENTS OF SPECIAL INTEREST

1p36 deletion syndrome;2-Hydroxyglutaric aciduria;5'nucleotidase increased;Acoustic neuritis;Acquired C1 inhibitor deficiency;Acquired epidermolysis bullosa;Acquired epileptic aphasia;Acute cutaneous lupus erythematosus;Acute disseminated encephalomyelitis;Acute encephalitis with refractory, repetitive partial seizures;Acute febrile neutrophilic dermatosis;Acute flaccid myelitis;Acute haemorrhagic leukoencephalitis;Acute haemorrhagic oedema of infancy;Acute kidney injury;Acute macular outer retinopathy;Acute motor axonal neuropathy;Acute motor-sensory axonal neuropathy;Acute myocardial infarction;Acute respiratory distress syndrome;Acute respiratory failure;Addison's disease;Administration site thrombosis;Administration site vasculitis;Adrenal thrombosis;Adverse event following immunisation;Ageusia;Agranulocytosis;Air embolism;Alanine aminotransferase abnormal;Alanine aminotransferase increased;Alcoholic seizure;Allergic bronchopulmonary mycosis;Allergic oedema;Alloimmune hepatitis;Alopecia areata;Alpers disease;Alveolar proteinosis;Ammonia abnormal;Ammonia increased;Amniotic cavity infection;Amygdalohippocampectomy;Amyloid arthropathy;Amyloidosis;Amyloidosis senile;Anaphylactic reaction;Anaphylactic shock;Anaphylactic transfusion reaction;Anaphylactoid reaction;Anaphylactoid shock;Anaphylactoid syndrome of pregnancy;Angioedema;Angiopathic neuropathy;Ankylosing spondylitis;Anosmia;Anti-acetylcholine receptor antibody positive;Anti-actin antibody positive;Anti-aquaporin-4 antibody positive;Anti-basal ganglia antibody positive;Anti-cyclic citrullinated peptide antibody positive;Anti-epithelial antibody positive;Anti-erythrocyte antibody positive;Anti-exosome complex antibody positive;Anti-GAD antibody negative;Anti-GAD antibody positive;Anti-ganglioside antibody positive;Antigliadin antibody positive;Anti-glomerular basement membrane antibody positive;Anti-glomerular basement membrane disease;Anti-glycyl-tRNA synthetase antibody positive;Anti-HLA antibody test positive;Anti-IA2 antibody positive;Anti-insulin antibody increased;Anti-insulin antibody positive;Anti-insulin receptor antibody increased;Anti-insulin receptor antibody positive;Anti-interferon antibody negative;Anti-interferon antibody positive;Anti-islet cell antibody positive;Antimitochondrial antibody positive;Anti-muscle specific kinase antibody positive;Anti-myelin-associated glycoprotein antibodies positive;Anti-myelin-associated glycoprotein associated polyneuropathy;Antimyocardial antibody positive;Anti-neuronal antibody positive;Antineutrophil cytoplasmic antibody increased;Antineutrophil cytoplasmic antibody positive;Anti-neutrophil cytoplasmic antibody positive vasculitis;Anti-NMDA antibody positive;Antinuclear antibody increased;Antinuclear antibody positive;Antiphospholipid antibodies positive;Antiphospholipid syndrome;Anti-platelet antibody positive;Anti-prothrombin antibody positive;Antiribosomal P antibody positive;Anti-RNA polymerase III antibody positive;Anti-saccharomyces cerevisiae antibody test positive;Anti-sperm antibody positive;Anti-SRP antibody positive;Antisynthetase syndrome;Anti-thyroid antibody positive;Anti-transglutaminase antibody increased;Anti-VGCC antibody positive;Anti-VGKC antibody positive;Anti-vimentin antibody positive;Antiviral prophylaxis;Antiviral treatment;Anti-zinc transporter 8 antibody positive;Aortic embolus;Aortic thrombosis;Aortitis;Aplasia pure red cell;Aplastic anaemia;Application site thrombosis;Application site vasculitis;Arrhythmia;Arterial bypass occlusion;Arterial bypass thrombosis;Arterial thrombosis;Arteriovenous fistula thrombosis;Arteriovenous graft site stenosis;Arteriovenous graft thrombosis;Arteritis;Arteritis

coronary;Arthralgia;Arthritis;Arthritis enteropathic;Ascites;Aseptic cavernous sinus thrombosis;Aspartate aminotransferase abnormal;Aspartate aminotransferase increased;Aspartate-glutamate-transporter deficiency;AST to platelet ratio index increased;AST/ALT ratio abnormal;Asthma;Asymptomatic COVID-19;Ataxia;Atheroembolism;Atonic seizures;Atrial thrombosis;Atrophic thyroiditis;Atypical benign partial epilepsy;Atypical pneumonia;Aura;Autoantibody positive;Autoimmune anaemia;Autoimmune aplastic anaemia;Autoimmune arthritis;Autoimmune blistering disease;Autoimmune cholangitis;Autoimmune colitis;Autoimmune demyelinating disease;Autoimmune dermatitis;Autoimmune disorder;Autoimmune encephalopathy;Autoimmune endocrine disorder;Autoimmune enteropathy;Autoimmune eye disorder;Autoimmune haemolytic anaemia;Autoimmune heparin-induced thrombocytopenia;Autoimmune hepatitis;Autoimmune hyperlipidaemia;Autoimmune hypothyroidism;Autoimmune inner ear disease;Autoimmune lung disease;Autoimmune lymphoproliferative syndrome;Autoimmune myocarditis;Autoimmune myositis;Autoimmune nephritis;Autoimmune neuropathy;Autoimmune neutropenia;Autoimmune pancreatitis;Autoimmune pancytopenia;Autoimmune pericarditis;Autoimmune retinopathy;Autoimmune thyroid disorder;Autoimmune thyroiditis;Autoimmune uveitis;Autoinflammation with infantile enterocolitis;Autoinflammatory disease;Automatism epileptic;Autonomic nervous system imbalance;Autonomic seizure;Axial spondyloarthritis;Axillary vein thrombosis;Axonal and demyelinating polyneuropathy;Axonal neuropathy;Bacterascites;Baltic myoclonic epilepsy;Band sensation;Basedow's disease;Basilar artery thrombosis;Basophilopenia;B-cell aplasia;Behcet's syndrome;Benign ethnic neutropenia;Benign familial neonatal convulsions;Benign familial pemphigus;Benign rolandic epilepsy;Beta-2 glycoprotein antibody positive;Bickerstaff's encephalitis;Bile output abnormal;Bile output decreased;Biliary ascites;Bilirubin conjugated abnormal;Bilirubin conjugated increased;Bilirubin urine present;Biopsy liver abnormal;Biotinidase deficiency;Birdshot chorioretinopathy;Blood alkaline phosphatase abnormal;Blood alkaline phosphatase increased;Blood bilirubin abnormal;Blood bilirubin increased;Blood bilirubin unconjugated increased;Blood cholinesterase abnormal;Blood cholinesterase decreased;Blood pressure decreased;Blood pressure diastolic decreased;Blood pressure systolic decreased;Blue toe syndrome;Brachiocephalic vein thrombosis;Brain stem embolism;Brain stem thrombosis;Bromosulphthalein test abnormal;Bronchial oedema;Bronchitis;Bronchitis mycoplasmal;Bronchitis viral;Bronchopulmonary aspergillosis allergic;Bronchospasm;Budd-Chiari syndrome;Bulbar palsy;Butterfly rash;C1q nephropathy;Caesarean section;Calcium embolism;Capillaritis;Caplan's syndrome;Cardiac amyloidosis;Cardiac arrest;Cardiac failure;Cardiac failure acute;Cardiac sarcoidosis;Cardiac ventricular thrombosis;Cardiogenic shock;Cardiolipin antibody positive;Cardiopulmonary failure;Cardio-respiratory arrest;Cardio-respiratory distress;Cardiovascular insufficiency;Carotid arterial embolus;Carotid artery thrombosis;Cataplexy;Catheter site thrombosis;Catheter site vasculitis;Cavernous sinus thrombosis;CDKL5 deficiency disorder;CEC syndrome;Cement embolism;Central nervous system lupus;Central nervous system vasculitis;Cerebellar artery thrombosis;Cerebellar embolism;Cerebral amyloid angiopathy;Cerebral arteritis;Cerebral artery embolism;Cerebral artery thrombosis;Cerebral gas embolism;Cerebral microembolism;Cerebral septic infarct;Cerebral thrombosis;Cerebral venous sinus thrombosis;Cerebral venous thrombosis;Cerebrospinal thrombotic

tamponade;Cerebrovascular accident;Change in seizure presentation;Chest discomfort;Child-Pugh-Turcotte score abnormal;Child-Pugh-Turcotte score increased;Chillblains;Choking;Choking sensation;Cholangitis sclerosing;Chronic autoimmune glomerulonephritis;Chronic cutaneous lupus erythematosus;Chronic fatigue syndrome;Chronic gastritis;Chronic inflammatory demyelinating polyradiculoneuropathy;Chronic lymphocytic inflammation with pontine perivascular enhancement responsive to steroids;Chronic recurrent multifocal osteomyelitis;Chronic respiratory failure;Chronic spontaneous urticaria;Circulatory collapse;Circumoral oedema;Circumoral swelling;Clinically isolated syndrome;Clonic convulsion;Coeliac disease;Cogan's syndrome;Cold agglutinins positive;Cold type haemolytic anaemia;Colitis;Colitis erosive;Colitis herpes;Colitis microscopic;Colitis ulcerative;Collagen disorder;Collagen-vascular disease;Complement factor abnormal;Complement factor C1 decreased;Complement factor C2 decreased;Complement factor C3 decreased;Complement factor C4 decreased;Complement factor decreased;Computerised tomogram liver abnormal;Concentric sclerosis;Congenital anomaly;Congenital bilateral perisylvian syndrome;Congenital herpes simplex infection;Congenital myasthenic syndrome;Congenital varicella infection;Congestive hepatopathy;Convulsion in childhood;Convulsions local;Convulsive threshold lowered;Coombs positive haemolytic anaemia;Coronary artery disease;Coronary artery embolism;Coronary artery thrombosis;Coronary bypass thrombosis;Coronavirus infection;Coronavirus test;Coronavirus test negative;Coronavirus test positive;Corpus callosotomy;Cough;Cough variant asthma;COVID-19;COVID-19 immunisation;COVID-19 pneumonia;COVID-19 prophylaxis;COVID-19 treatment;Cranial nerve disorder;Cranial nerve palsies multiple;Cranial nerve paralysis;CREST syndrome;Crohn's disease;Cryofibrinogenaemia;Cryoglobulinaemia;CSF oligoclonal band present;CSWS syndrome;Cutaneous amyloidosis;Cutaneous lupus erythematosus;Cutaneous sarcoidosis;Cutaneous vasculitis;Cyanosis;Cyclic neutropenia;Cystitis interstitial;Cytokine release syndrome;Cytokine storm;De novo purine synthesis inhibitors associated acute inflammatory syndrome;Death neonatal;Deep vein thrombosis;Deep vein thrombosis postoperative;Deficiency of bile secretion;Deja vu;Demyelinating polyneuropathy;Demyelination;Dermatitis;Dermatitis bullous;Dermatitis herpetiformis;Dermatomyositis;Device embolisation;Device related thrombosis;Diabetes mellitus;Diabetic ketoacidosis;Diabetic mastopathy;Dialysis amyloidosis;Dialysis membrane reaction;Diastolic hypotension;Diffuse vasculitis;Digital pitting scar;Disseminated intravascular coagulation;Disseminated intravascular coagulation in newborn;Disseminated neonatal herpes simplex;Disseminated varicella;Disseminated varicella zoster vaccine virus infection;Disseminated varicella zoster virus infection;DNA antibody positive;Double cortex syndrome;Double stranded DNA antibody positive;Dreamy state;Dressler's syndrome;Drop attacks;Drug withdrawal convulsions;Dyspnoea;Early infantile epileptic encephalopathy with burst-suppression;Eclampsia;Eczema herpeticum;Embolia cutis medicamentosa;Embolic cerebellar infarction;Embolic cerebral infarction;Embolic pneumonia;Embolic stroke;Embolism;Embolism arterial;Embolism venous;Encephalitis;Encephalitis allergic;Encephalitis autoimmune;Encephalitis brain stem;Encephalitis haemorrhagic;Encephalitis periaxialis diffusa;Encephalitis post immunisation;Encephalomyelitis;Encephalopathy;Endocrine disorder;Endocrine ophthalmopathy;Endotracheal intubation;Enteritis;Enteritis leukopenic;Enterobacter pneumonia;Enterocolitis;Enteropathic spondylitis;Eosinopenia;Eosinophilic

fasciitis;Eosinophilic granulomatosis with polyangiitis;Eosinophilic oesophagitis;Epidermolysis;Epilepsy;Epilepsy surgery;Epilepsy with myoclonic-atonic seizures;Epileptic aura;Epileptic psychosis;Erythema;Erythema induratum;Erythema multiforme;Erythema nodosum;Evans syndrome;Exanthema subitum;Expanded disability status scale score decreased;Expanded disability status scale score increased;Exposure to communicable disease;Exposure to SARS-CoV-2;Eye oedema;Eye pruritus;Eye swelling;Eyelid oedema;Face oedema;Facial paralysis;Facial paresis;Faciobrachial dystonic seizure;Fat embolism;Febrile convulsion;Febrile infection-related epilepsy syndrome;Febrile neutropenia;Felty's syndrome;Femoral artery embolism;Fibrillary glomerulonephritis;Fibromyalgia;Flushing;Foaming at mouth;Focal cortical resection;Focal dyscognitive seizures;Foetal distress syndrome;Foetal placental thrombosis;Foetor hepaticus;Foreign body embolism;Frontal lobe epilepsy;Fulminant type 1 diabetes mellitus;Galactose elimination capacity test abnormal;Galactose elimination capacity test decreased;Gamma-glutamyltransferase abnormal;Gamma-glutamyltransferase increased;Gastritis herpes;Gastrointestinal amyloidosis;Gelastic seizure;Generalised onset non-motor seizure;Generalised tonic-clonic seizure;Genital herpes;Genital herpes simplex;Genital herpes zoster;Giant cell arteritis;Glomerulonephritis;Glomerulonephritis membranoproliferative;Glomerulonephritis membranous;Glomerulonephritis rapidly progressive;Glossopharyngeal nerve paralysis;Glucose transporter type 1 deficiency syndrome;Glutamate dehydrogenase increased;Glycocholic acid increased;GM2 gangliosidosis;Goodpasture's syndrome;Graft thrombosis;Granulocytopenia;Granulocytopenia neonatal;Granulomatosis with polyangiitis;Granulomatous dermatitis;Grey matter heterotopia;Guanase increased;Guillain-Barre syndrome;Haemolytic anaemia;Haemophagocytic lymphohistiocytosis;Haemorrhage;Haemorrhagic ascites;Haemorrhagic disorder;Haemorrhagic pneumonia;Haemorrhagic varicella syndrome;Haemorrhagic vasculitis;Hantavirus pulmonary infection;Hashimoto's encephalopathy;Hashitoxicosis;Hemimegalencephaly;Henoch-Schonlein purpura;Henoch-Schonlein purpura nephritis;Hepaplastin abnormal;Hepaplastin decreased;Heparin-induced thrombocytopenia;Hepatic amyloidosis;Hepatic artery embolism;Hepatic artery flow decreased;Hepatic artery thrombosis;Hepatic enzyme abnormal;Hepatic enzyme decreased;Hepatic enzyme increased;Hepatic fibrosis marker abnormal;Hepatic fibrosis marker increased;Hepatic function abnormal;Hepatic hydrothorax;Hepatic hypertrophy;Hepatic hypoperfusion;Hepatic lymphocytic infiltration;Hepatic mass;Hepatic pain;Hepatic sequestration;Hepatic vascular resistance increased;Hepatic vascular thrombosis;Hepatic vein embolism;Hepatic vein thrombosis;Hepatic venous pressure gradient abnormal;Hepatic venous pressure gradient increased;Hepatitis;Hepatobiliary scan abnormal;Hepatomegaly;Hepatosplenomegaly;Hereditary angioedema with C1 esterase inhibitor deficiency;Herpes dermatitis;Herpes gestationis;Herpes oesophagitis;Herpes ophthalmic;Herpes pharyngitis;Herpes sepsis;Herpes simplex;Herpes simplex cervicitis;Herpes simplex colitis;Herpes simplex encephalitis;Herpes simplex gastritis;Herpes simplex hepatitis;Herpes simplex meningitis;Herpes simplex meningoencephalitis;Herpes simplex meningomyelitis;Herpes simplex necrotising retinopathy;Herpes simplex oesophagitis;Herpes simplex otitis externa;Herpes simplex pharyngitis;Herpes simplex pneumonia;Herpes simplex reactivation;Herpes simplex sepsis;Herpes simplex viraemia;Herpes simplex virus conjunctivitis neonatal;Herpes simplex visceral;Herpes virus

infection;Herpes zoster;Herpes zoster cutaneous disseminated;Herpes zoster infection neurological;Herpes zoster meningitis;Herpes zoster meningoencephalitis;Herpes zoster meningomyelitis;Herpes zoster meningoradiculitis;Herpes zoster necrotising retinopathy;Herpes zoster oticus;Herpes zoster pharyngitis;Herpes zoster reactivation;Herpetic radiculopathy;Histone antibody positive;Hoigne's syndrome;Human herpesvirus 6 encephalitis;Human herpesvirus 6 infection;Human herpesvirus 6 infection reactivation;Human herpesvirus 7 infection;Human herpesvirus 8 infection;Hyperammonaemia;Hyperbilirubinaemia;Hypercholia;Hypergammaglobulinaemia benign monoclonal;Hyperglycaemic seizure;Hypersensitivity;Hypersensitivity vasculitis;Hyperthyroidism;Hypertransaminaemia;Hyperventilation;Hypoalbuminaemia;Hypocalcaemic seizure;Hypogammaglobulinaemia;Hypoglossal nerve paralysis;Hypoglossal nerve paresis;Hypoglycaemic seizure;Hyponatraemic seizure;Hypotension;Hypotensive crisis;Hypothermia hammer syndrome;Hypothyroidism;Hypoxia;Idiopathic CD4 lymphocytopenia;Idiopathic generalised epilepsy;Idiopathic interstitial pneumonia;Idiopathic neutropenia;Idiopathic pulmonary fibrosis;IgA nephropathy;IgM nephropathy;IIIrd nerve paralysis;IIIrd nerve paresis;Iliac artery embolism;Immune thrombocytopenia;Immune-mediated adverse reaction;Immune-mediated cholangitis;Immune-mediated cholestasis;Immune-mediated cytopenia;Immune-mediated encephalitis;Immune-mediated encephalopathy;Immune-mediated endocrinopathy;Immune-mediated enterocolitis;Immune-mediated gastritis;Immune-mediated hepatic disorder;Immune-mediated hepatitis;Immune-mediated hyperthyroidism;Immune-mediated hypothyroidism;Immune-mediated myocarditis;Immune-mediated myositis;Immune-mediated nephritis;Immune-mediated neuropathy;Immune-mediated pancreatitis;Immune-mediated pneumonitis;Immune-mediated renal disorder;Immune-mediated thyroiditis;Immune-mediated uveitis;Immunoglobulin G4 related disease;Immunoglobulins abnormal;Implant site thrombosis;Inclusion body myositis;Infantile genetic agranulocytosis;Infantile spasms;Infected vasculitis;Infective thrombosis;Inflammation;Inflammatory bowel disease;Infusion site thrombosis;Infusion site vasculitis;Injection site thrombosis;Injection site urticaria;Injection site vasculitis;Instillation site thrombosis;Insulin autoimmune syndrome;Interstitial granulomatous dermatitis;Interstitial lung disease;Intracardiac mass;Intracardiac thrombus;Intracranial pressure increased;Intrapericardial thrombosis;Intrinsic factor antibody abnormal;Intrinsic factor antibody positive;IPEX syndrome;Irregular breathing;IRVAN syndrome;IVth nerve paralysis;IVth nerve paresis;JC polyomavirus test positive;JC virus CSF test positive;Jeavons syndrome;Jugular vein embolism;Jugular vein thrombosis;Juvenile idiopathic arthritis;Juvenile myoclonic epilepsy;Juvenile polymyositis;Juvenile psoriatic arthritis;Juvenile spondyloarthritis;Kaposi sarcoma inflammatory cytokine syndrome;Kawasaki's disease;Kayser-Fleischer ring;Keratoderma blenorrhagica;Ketosis-prone diabetes mellitus;Kounis syndrome;Lafora's myoclonic epilepsy;Lamb's excrescences;Laryngeal dyspnoea;Laryngeal oedema;Laryngeal rheumatoid arthritis;Laryngospasm;Laryngotracheal oedema;Latent autoimmune diabetes in adults;LE cells present;Lemierre syndrome;Lennox-Gastaut syndrome;Leucine aminopeptidase increased;Leukoencephalomyelitis;Leukoencephalopathy;Leukopenia;Leukopenia neonatal;Lewis-Sumner syndrome;Lhermitte's sign;Lichen planopilaris;Lichen planus;Lichen sclerosus;Limbic encephalitis;Linear IgA disease;Lip oedema;Lip swelling;Liver function test abnormal;Liver function test decreased;Liver function test increased;Liver induration;Liver injury;Liver iron concentration abnormal;Liver iron concentration

increased;Liver opacity;Liver palpable;Liver sarcoidosis;Liver scan abnormal;Liver tenderness;Low birth weight baby;Lower respiratory tract herpes infection;Lower respiratory tract infection;Lower respiratory tract infection viral;Lung abscess;Lupoid hepatic cirrhosis;Lupus cystitis;Lupus encephalitis;Lupus endocarditis;Lupus enteritis;Lupus hepatitis;Lupus myocarditis;Lupus myositis;Lupus nephritis;Lupus pancreatitis;Lupus pleurisy;Lupus pneumonitis;Lupus vasculitis;Lupus-like syndrome;Lymphocytic hypophysitis;Lymphocytopenia neonatal;Lymphopenia;MAGIC syndrome;Magnetic resonance imaging liver abnormal;Magnetic resonance proton density fat fraction measurement;Mahler sign;Manufacturing laboratory analytical testing issue;Manufacturing materials issue;Manufacturing production issue;Marburg's variant multiple sclerosis;Marchiafava-Bignami disease;Marine Lenhart syndrome;Mastocytic enterocolitis;Maternal exposure during pregnancy;Medical device site thrombosis;Medical device site vasculitis;MELAS syndrome;Meningitis;Meningitis aseptic;Meningitis herpes;Meningoencephalitis herpes simplex neonatal;Meningoencephalitis herpetic;Meningomyelitis herpes;MERS-CoV test;MERS-CoV test negative;MERS-CoV test positive;Mesangioproliferative glomerulonephritis;Mesenteric artery embolism;Mesenteric artery thrombosis;Mesenteric vein thrombosis;Metapneumovirus infection;Metastatic cutaneous Crohn's disease;Metastatic pulmonary embolism;Microangiopathy;Microembolism;Microscopic polyangiitis;Middle East respiratory syndrome;Migraine-triggered seizure;Miliary pneumonia;Miller Fisher syndrome;Mitochondrial aspartate aminotransferase increased;Mixed connective tissue disease;Model for end stage liver disease score abnormal;Model for end stage liver disease score increased;Molar ratio of total branched-chain amino acid to tyrosine;Molybdenum cofactor deficiency;Monocytopenia;Mononeuritis;Mononeuropathy multiplex;Morphaea;Morvan syndrome;Mouth swelling;Moyamoya disease;Multifocal motor neuropathy;Multiple organ dysfunction syndrome;Multiple sclerosis;Multiple sclerosis relapse;Multiple sclerosis relapse prophylaxis;Multiple subpial transection;Multisystem inflammatory syndrome in children;Muscular sarcoidosis;Myasthenia gravis;Myasthenia gravis crisis;Myasthenia gravis neonatal;Myasthenic syndrome;Myelitis;Myelitis transverse;Myocardial infarction;Myocarditis;Myocarditis post infection;Myoclonic epilepsy;Myoclonic epilepsy and ragged-red fibres;Myokymia;Myositis;Narcolepsy;Nasal herpes;Nasal obstruction;Necrotising herpetic retinopathy;Neonatal Crohn's disease;Neonatal epileptic seizure;Neonatal lupus erythematosus;Neonatal mucocutaneous herpes simplex;Neonatal pneumonia;Neonatal seizure;Nephritis;Nephrogenic systemic fibrosis;Neuralgic amyotrophy;Neuritis;Neuritis cranial;Neuromyelitis optica pseudo relapse;Neuromyelitis optica spectrum disorder;Neuromyotonia;Neuronal neuropathy;Neuropathy peripheral;Neuropathy, ataxia, retinitis pigmentosa syndrome;Neuropsychiatric lupus;Neurosarcoidosis;Neutropenia;Neutropenia neonatal;Neutropenic colitis;Neutropenic infection;Neutropenic sepsis;Nodular rash;Nodular vasculitis;Noninfectious myelitis;Noninfective encephalitis;Noninfective encephalomyelitis;Noninfective oophoritis;Obstetrical pulmonary embolism;Occupational exposure to communicable disease;Occupational exposure to SARS-CoV-2;Ocular hyperaemia;Ocular myasthenia;Ocular pemphigoid;Ocular sarcoidosis;Ocular vasculitis;Oculofacial paralysis;Oedema;Oedema blister;Oedema due to hepatic disease;Oedema mouth;Oesophageal achalasia;Ophthalmic artery thrombosis;Ophthalmic herpes simplex;Ophthalmic herpes zoster;Ophthalmic vein thrombosis;Optic neuritis;Optic

neuropathy;Optic perineuritis;Oral herpes;Oral lichen planus;Oropharyngeal oedema;Oropharyngeal spasm;Oropharyngeal swelling;Osmotic demyelination syndrome;Ovarian vein thrombosis;Overlap syndrome;Paediatric autoimmune neuropsychiatric disorders associated with streptococcal infection;Paget-Schroetter syndrome;Palindromic rheumatism;Palisaded neutrophilic granulomatous dermatitis;Palmoplantar keratoderma;Palpable purpura;Pancreatitis;Panencephalitis;Papillophlebitis;Paracancerous pneumonia;Paradoxical embolism;Parainfluenzae viral laryngotracheobronchitis;Paraneoplastic dermatomyositis;Paraneoplastic pemphigus;Paraneoplastic thrombosis;Paresis cranial nerve;Parietal cell antibody positive;Paroxysmal nocturnal haemoglobinuria;Partial seizures;Partial seizures with secondary generalisation;Patient isolation;Pelvic venous thrombosis;Pemphigoid;Pemphigus;Penile vein thrombosis;Pericarditis;Pericarditis lupus;Perihepatic discomfort;Periorbital oedema;Periorbital swelling;Peripheral artery thrombosis;Peripheral embolism;Peripheral ischaemia;Peripheral vein thrombus extension;Periportal oedema;Peritoneal fluid protein abnormal;Peritoneal fluid protein decreased;Peritoneal fluid protein increased;Peritonitis lupus;Pernicious anaemia;Petit mal epilepsy;Pharyngeal oedema;Pharyngeal swelling;Pityriasis lichenoides et varioliformis acuta;Placenta praevia;Pleuroparenchymal fibroelastosis;Pneumobilia;Pneumonia;Pneumonia adenoviral;Pneumonia cytomegaloviral;Pneumonia herpes viral;Pneumonia influenzal;Pneumonia measles;Pneumonia mycoplasmal;Pneumonia necrotising;Pneumonia parainfluenzae viral;Pneumonia respiratory syncytial viral;Pneumonia viral;POEMS syndrome;Polyarteritis nodosa;Polyarthritis;Polychondritis;Polyglandular autoimmune syndrome type I;Polyglandular autoimmune syndrome type II;Polyglandular autoimmune syndrome type III;Polyglandular disorder;Polymicrogyria;Polymyalgia rheumatica;Polymyositis;Polyneuropathy;Polyneuropathy idiopathic progressive;Portal pyaemia;Portal vein embolism;Portal vein flow decreased;Portal vein pressure increased;Portal vein thrombosis;Portosplenomesenteric venous thrombosis;Post procedural hypotension;Post procedural pneumonia;Post procedural pulmonary embolism;Post stroke epilepsy;Post stroke seizure;Post thrombotic retinopathy;Post thrombotic syndrome;Post viral fatigue syndrome;Postictal headache;Postictal paralysis;Postictal psychosis;Postictal state;Postoperative respiratory distress;Postoperative respiratory failure;Postoperative thrombosis;Postpartum thrombosis;Postpartum venous thrombosis;Postpericardiotomy syndrome;Post-traumatic epilepsy;Postural orthostatic tachycardia syndrome;Precerebral artery thrombosis;Pre-eclampsia;Preictal state;Premature labour;Premature menopause;Primary amyloidosis;Primary biliary cholangitis;Primary progressive multiple sclerosis;Procedural shock;Proctitis herpes;Proctitis ulcerative;Product availability issue;Product distribution issue;Product supply issue;Progressive facial hemiatrophy;Progressive multifocal leukoencephalopathy;Progressive multiple sclerosis;Progressive relapsing multiple sclerosis;Prosthetic cardiac valve thrombosis;Pruritus;Pruritus allergic;Pseudovasculitis;Psoriasis;Psoriatic arthropathy;Pulmonary amyloidosis;Pulmonary artery thrombosis;Pulmonary embolism;Pulmonary fibrosis;Pulmonary haemorrhage;Pulmonary microemboli;Pulmonary oil microembolism;Pulmonary renal syndrome;Pulmonary sarcoidosis;Pulmonary sepsis;Pulmonary thrombosis;Pulmonary tumour thrombotic microangiopathy;Pulmonary vasculitis;Pulmonary veno-occlusive disease;Pulmonary venous thrombosis;Pyoderma gangrenosum;Pyostomatitis vegetans;Pyrexia;Quarantine;Radiation leukopenia;Radiculitis

brachial;Radiologically isolated syndrome;Rash;Rash erythematous;Rash pruritic;Rasmussen encephalitis;Raynaud's phenomenon;Reactive capillary endothelial proliferation;Relapsing multiple sclerosis;Relapsing-remitting multiple sclerosis;Renal amyloidosis;Renal arteritis;Renal artery thrombosis;Renal embolism;Renal failure;Renal vascular thrombosis;Renal vasculitis;Renal vein embolism;Renal vein thrombosis;Respiratory arrest;Respiratory disorder;Respiratory distress;Respiratory failure;Respiratory paralysis;Respiratory syncytial virus bronchiolitis;Respiratory syncytial virus bronchitis;Retinal artery embolism;Retinal artery occlusion;Retinal artery thrombosis;Retinal vascular thrombosis;Retinal vasculitis;Retinal vein occlusion;Retinal vein thrombosis;Retinol binding protein decreased;Retinopathy;Retrograde portal vein flow;Retroperitoneal fibrosis;Reversible airways obstruction;Reynold's syndrome;Rheumatic brain disease;Rheumatic disorder;Rheumatoid arthritis;Rheumatoid factor increased;Rheumatoid factor positive;Rheumatoid factor quantitative increased;Rheumatoid lung;Rheumatoid neutrophilic dermatosis;Rheumatoid nodule;Rheumatoid nodule removal;Rheumatoid scleritis;Rheumatoid vasculitis;Saccadic eye movement;SAPHO syndrome;Sarcoidosis;SARS-CoV-1 test;SARS-CoV-1 test negative;SARS-CoV-1 test positive;SARS-CoV-2 antibody test;SARS-CoV-2 antibody test negative;SARS-CoV-2 antibody test positive;SARS-CoV-2 carrier;SARS-CoV-2 sepsis;SARS-CoV-2 test;SARS-CoV-2 test false negative;SARS-CoV-2 test false positive;SARS-CoV-2 test negative;SARS-CoV-2 test positive;SARS-CoV-2 viraemia;Satoyoshi syndrome;Schizencephaly;Scleritis;Sclerodactylia;Scleroderma;Scleroderma associated digital ulcer;Scleroderma renal crisis;Scleroderma-like reaction;Secondary amyloidosis;Secondary cerebellar degeneration;Secondary progressive multiple sclerosis;Segmented hyalinising vasculitis;Seizure;Seizure anoxic;Seizure cluster;Seizure like phenomena;Seizure prophylaxis;Sensation of foreign body;Septic embolus;Septic pulmonary embolism;Severe acute respiratory syndrome;Severe myoclonic epilepsy of infancy;Shock;Shock symptom;Shrinking lung syndrome;Shunt thrombosis;Silent thyroiditis;Simple partial seizures;Sjogren's syndrome;Skin swelling;SLE arthritis;Smooth muscle antibody positive;Sneezing;Spinal artery embolism;Spinal artery thrombosis;Splenic artery thrombosis;Splenic embolism;Splenic thrombosis;Splenic vein thrombosis;Spondylitis;Spondyloarthropathy;Spontaneous heparin-induced thrombocytopenia syndrome;Status epilepticus;Stevens-Johnson syndrome;Stiff leg syndrome;Stiff person syndrome;Stillbirth;Still's disease;Stoma site thrombosis;Stoma site vasculitis;Stress cardiomyopathy;Stridor;Subacute cutaneous lupus erythematosus;Subacute endocarditis;Subacute inflammatory demyelinating polyneuropathy;Subclavian artery embolism;Subclavian artery thrombosis;Subclavian vein thrombosis;Sudden unexplained death in epilepsy;Superior sagittal sinus thrombosis;Susac's syndrome;Suspected COVID-19;Swelling;Swelling face;Swelling of eyelid;Swollen tongue;Sympathetic ophthalmia;Systemic lupus erythematosus;Systemic lupus erythematosus disease activity index abnormal;Systemic lupus erythematosus disease activity index decreased;Systemic lupus erythematosus disease activity index increased;Systemic lupus erythematosus rash;Systemic scleroderma;Systemic sclerosis pulmonary;Tachycardia;Tachypnoea;Takayasu's arteritis;Temporal lobe epilepsy;Terminal ileitis;Testicular autoimmunity;Throat tightness;Thromboangiitis obliterans;Thrombocytopenia;Thrombocytopenic purpura;Thrombophlebitis;Thrombophlebitis migrans;Thrombophlebitis

neonatal;Thrombophlebitis septic;Thrombophlebitis superficial;Thromboplastin antibody positive;Thrombosis;Thrombosis corpora cavernosa;Thrombosis in device;Thrombosis mesenteric vessel;Thrombotic cerebral infarction;Thrombotic microangiopathy;Thrombotic stroke;Thrombotic thrombocytopenic purpura;Thyroid disorder;Thyroid stimulating immunoglobulin increased;Thyroiditis;Tongue amyloidosis;Tongue biting;Tongue oedema;Tonic clonic movements;Tonic convulsion;Tonic posturing;Topectomy;Total bile acids increased;Toxic epidermal necrolysis;Toxic leukoencephalopathy;Toxic oil syndrome;Tracheal obstruction;Tracheal oedema;Tracheobronchitis;Tracheobronchitis mycoplasmal;Tracheobronchitis viral;Transaminases abnormal;Transaminases increased;Transfusion-related alloimmune neutropenia;Transient epileptic amnesia;Transverse sinus thrombosis;Trigeminal nerve paresis;Trigeminal neuralgia;Trigeminal palsy;Truncus coeliacus thrombosis;Tuberous sclerosis complex;Tubulointerstitial nephritis and uveitis syndrome;Tumefactive multiple sclerosis;Tumour embolism;Tumour thrombosis;Type 1 diabetes mellitus;Type I hypersensitivity;Type III immune complex mediated reaction;Uhthoff's phenomenon;Ulcerative keratitis;Ultrasound liver abnormal;Umbilical cord thrombosis;Uncinate fits;Undifferentiated connective tissue disease;Upper airway obstruction;Urine bilirubin increased;Urobilinogen urine decreased;Urobilinogen urine increased;Urticaria;Urticaria papular;Urticarial vasculitis;Uterine rupture;Uveitis;Vaccination site thrombosis;Vaccination site vasculitis;Vagus nerve paralysis;Varicella;Varicella keratitis;Varicella post vaccine;Varicella zoster gastritis;Varicella zoster oesophagitis;Varicella zoster pneumonia;Varicella zoster sepsis;Varicella zoster virus infection;Vasa praevia;Vascular graft thrombosis;Vascular pseudoaneurysm thrombosis;Vascular purpura;Vascular stent thrombosis;Vasculitic rash;Vasculitic ulcer;Vasculitis;Vasculitis gastrointestinal;Vasculitis necrotising;Vena cava embolism;Vena cava thrombosis;Venous intravasation;Venous recanalisation;Venous thrombosis;Venous thrombosis in pregnancy;Venous thrombosis limb;Venous thrombosis neonatal;Vertebral artery thrombosis;Vessel puncture site thrombosis;Visceral venous thrombosis;VIth nerve paralysis;VIth nerve paresis;Vitiligo;Vocal cord paralysis;Vocal cord paresis;Vogt-Koyanagi-Harada disease;Warm type haemolytic anaemia;Wheezing;White nipple sign;XIth nerve paralysis;X-ray hepatobiliary abnormal;Young's syndrome;Zika virus associated Guillain Barre syndrome.

## APPENDIX 5.1 OBSERVED VERSUS EXPECTED ANALYSIS FOR ADVERSE EVENTS OF SPECIAL INTEREST

### 2.5. INTRODUCTION

As part of ongoing signal detection activities, MAH is conducting observed versus expected analyses to determine whether the reported counts of spontaneously reported AESI are higher than expected based on the “natural” background rates of the AESI in the absence of vaccine exposure, as outlined in the “Considerations on core requirements for RMP’s of COVID-19 vaccines: coreRMP19 guidance”<sup>1</sup> and by Mahaux et al.<sup>2</sup> Analyses are reported cumulatively for the period since the vaccine was first granted emergency use authorization (9 December 2020) as well as for the monthly reporting interval (1 April 2021 – 29 April 2021).

### 2.6. METHODS

#### 2.6.1. Variables

The AESI list included in this report is informed by recommendations from the following expert groups and regulatory authorities: Brighton Collaboration (SPEAC), ACCESS protocol, US CDC (VAERS surveillance) and MHRA. For SMSR 5, the MAH has added Disseminated intravascular coagulation to the unadjusted observed to expected ratio analyses compared to SMSR 4.

#### 2.6.2. Data sources and analysis

##### 2.6.2.1. Observed cases

Spontaneously reported case counts are processed from the safety database via the pre-defined MedDRA preferred term search criteria provided in Table 3 (Section 2.7). Unless otherwise noted, events have not undergone adjudication, which is considered appropriate in a setting where the goal of observed versus expected analyses is signal detection.<sup>2</sup>

##### 2.6.2.2. Expected cases

Expected case counts were determined cumulatively and for the monthly interval by multiplying estimated background incidence rates by the duration of post-vaccination exposure time.<sup>3</sup> Duration of exposure time was estimated for the cumulative and interval period using a 21-day risk window and no risk window.<sup>3</sup>

- Background incidence rates: Sources of background incidence rate estimates are noted in Table 2.
  - In this monthly report, the MAH used the background rates of AESI provided by the ACCESS/VAC4EU initiative as the primary source for generating expected counts of events. The incidence rates (narrow case definitions) from 2017-2019 were averaged within each of the ten data sources where available. From these, a single average rate was selected based on the range of observed values, type of care typically sought for the AESI (e.g. hospital or general practitioner), and relevant characteristics of the databases, as described in the ACCESS User Guide<sup>4</sup>. One exception was for cutaneous vasculitis, which used the 2019 narrow rate from BIFAP. Compared to the previous report,

SMSR #5 uses updated rates for acute disseminated encephalomyelitis; acute kidney injury/renal failure; acute liver injury/liver injury; acute respiratory distress syndrome; ageusia/anosmia; arrhythmia; chillblains; coronary artery disease; deep vein thrombosis; disseminated intravascular coagulation; erythema multiforme; Guillain-Barré syndrome; haemorrhagic stroke; heart failure; idiopathic thrombocytopenic purpura, autoimmune thrombocytopenia; multisystem inflammatory syndrome; pulmonary embolus; seizures/convulsions/seizure disorders (including febrile); transverse myelitis; type 1 diabetes; and vasculitis.

- For AESIs not available through the ACCESS project, incidence rates were identified in the literature and analyses conducted within electronic health records. If a plausible range of background rates was identified across multiple data sources, a single rate from the low end of the range was selected. This conservative approach is more likely to identify a signal than an approach using a higher background rate.<sup>5</sup>
- Post vaccination exposure time: Estimated exposure time was derived from publicly available information reported by countries where the Pfizer-BioNTech COVID-19 vaccine is authorized.<sup>6</sup> For periods when more than one vaccine brand was authorized for use in each country, the doses administered were assumed to be divided equally by the number of brands of vaccines authorized. The estimate of administered doses does not reflect exposure in persons vaccinated in countries that did not publicly report. Exposure time was calculated using a 21-day risk window and no risk window for both the interval and cumulative period.
  - Of note, the 21-day risk window is not applied to the observed case count. All cases observed during the interval or cumulative period are included regardless of proximity of event to date of vaccination. This is a conservative approach for the purpose of signal detection.

## 2.7. RESULTS: OBSERVED VERSUS EXPECTED ANALYSES

**Table 1. Observed to Expected (O/E) Ratios of Spontaneously Reported Adverse Events of Special Interest (AESI)**

AESI	21-Day Risk Window, Cumulative		No Risk Window, Cumulative		21-Day Risk Window, Interval		No Risk Window, Interval	
	O/E Ratio	95% CI	O/E Ratio	95% CI	O/E Ratio	95% CI	O/E Ratio	95% CI

**Table 3. Preferred Terms (PT) Used to Identify Spontaneously Reported Adverse Events of Special Interest (AESI)**

AESI	PTs
Acute disseminated encephalomyelitis (ADEM)	Acute disseminated encephalomyelitis, encephalitis, encephalopathy, encephalomyelitis
Acute kidney injury/renal failure	Acute kidney injury, renal failure
Acute liver injury/liver injury	Liver injury
Acute myocardial infarction/myocardial infarction	Acute myocardial infarction, myocardial infarction
Acute respiratory distress syndrome (ARDS)	Acute respiratory distress syndrome
Ageusia/anosmia	Ageusia, anosmia
Arrhythmia	Arrhythmia
Autoimmune thyroiditis	Autoimmune thyroiditis
Behcet's syndrome	Behcet's syndrome
Bell's palsy	Facial paresis, facial paralysis, oculofacial paralysis
Chillblains	Chillblains
Chronic fatigue syndrome/ME/PVFS	Chronic fatigue syndrome, post viral fatigue syndrome
Coronary artery disease	Coronary artery disease
Cutaneous vasculitis	Cutaneous vasculitis, vasculitic rash, urticarial vasculitis
Death	Fatal clinical outcome
Deep vein thrombosis	Deep vein thrombosis
Disseminated intravascular coagulation	Disseminated intravascular coagulation, disseminated intravascular coagulation in newborn
Erythema multiforme	Erythema multiforme
Fibromyalgia	Fibromyalgia
Giant cell arteritis	Giant cell arteritis
Guillain-Barré syndrome	Guillain-Barre syndrome
Haemorrhage	Haemorrhage
Haemorrhagic stroke	Haemorrhagic stroke, cerebral haemorrhage, cerebral haematoma, subarachnoid haemorrhage, brain stem haemorrhage, haemorrhage intracranial, intracranial haematoma
Heart failure	Cardiac failure, cardiac failure acute
Herpes zoster	Herpes zoster, ophthalmic herpes zoster, herpes zoster reactivation, herpes zoster infection neurological, herpes zoster oticus, herpes zoster cutaneous disseminated, varicella zoster virus infection
Idiopathic thrombocytopenic purpura, autoimmune thrombocytopenia	Immune thrombocytopenia, thrombocytopenia, thrombotic thrombocytopenic purpura, thrombocytopenic purpura
Ischemic stroke	Ischaemic stroke, cerebrovascular accident, cerebral infarction, basal ganglia stroke, cerebral thrombosis, cerebral venous sinus thrombosis, thrombotic stroke, basal ganglia infarction, basilar artery thrombosis, brain stem stroke, lacunar infarction
Limb ischemia	Peripheral ischaemia
Meningitis	Meningitis, meningitis aseptic
Multiple sclerosis (MS)	Optic neuritis, multiple sclerosis relapse, multiple sclerosis
Multisystem inflammatory syndrome	Systemic inflammatory response syndrome, multiple organ dysfunction syndrome, multisystem inflammatory syndrome in children
Myasthenia gravis	Myasthenia gravis
Myocarditis	Myocarditis

**Table 3. Preferred Terms (PT) Used to Identify Spontaneously Reported Adverse Events of Special Interest (AESI)**

AESI	PTs
Narcolepsy	Cataplexy, narcolepsy
Pericarditis	Pericarditis
Polyneuropathy	Polyneuropathy, neuropathy peripheral
Postural orthostatic tachycardia syndrome	Postural orthostatic tachycardia syndrome
Pulmonary embolus	Pulmonary embolism
Rheumatoid arthritis, polyarthritis	Rheumatoid arthritis, polyarthritis
Seizures/convulsions/seizure disorders (including febrile)	Febrile convulsion, seizure, generalized tonic-clonic seizure, partial seizures
Transverse myelitis	Myelitis transverse, myelitis
Type 1 diabetes	Type 1 diabetes mellitus
Vasculitis	Vasculitis, polymyalgia rheumatica

For most cumulative and interval data, the upper limit of the 95% CI is substantially less than one. For most AESI, the ratio is higher in the interval period than in the cumulative even when restricted to the 21-day risk window. This could reflect changes in the accuracy of the person year estimate, an increased reporting rate over time, an increased reporting rate with second dose as the proportion of vaccinees receiving a second dose is increasing over time, higher rates of spontaneous event reporting in countries where the vaccine was recently authorized, or a combination of these.

For purposes of signal detection, the MAH considers events for which the upper level of the 95% CI exceeds one for at least one of the risk periods (cumulative, interval) or risk windows (21 weeks, no risk window). While typically the lower level of the 95% CI would be the criterion for evaluating a difference from expectation, in this setting, given the generally substantial gap between the lower limit and one, an upper limit in excess of one might suggest the possibility of an excess risk in vaccinees.

Acute disseminated encephalomyelitis (ADEM), ageusia/anosmia, Guillain-Barré syndrome, multisystem inflammatory syndrome, myasthenia gravis, polyneuropathy, and transverse myelitis are further discussed below.

## 2.8. DISCUSSION

### 2.8.1. Cardiogenic shock

Although requested by regulatory authorities, cardiogenic shock is not included in this analysis since relevant background rates have not been identified at this time.

### 2.8.2. Ageusia/anosmia and multisystem inflammatory syndrome

For ageusia/anosmia, the upper level of the confidence interval exceeds one for both the 21-day and no risk windows in the interval period (01-30 April 2021) and the cumulative period, suggesting that the observed rate is higher in vaccinees compared to the background rate, which was generated from the ACCESS project data. Ageusia/anosmia is notably a symptom of COVID-19 illness. Contemporaneous background rates of this endpoint are therefore likely to be increased due to COVID-19 compared to the 2017-2019 data used for the

background rate. The MAH's COVID-19 vaccine requires two doses spaced 21 days apart before achieving maximum effectiveness. It is possible that COVID-19 may occur within the 21-day window between doses. Additionally, general awareness of ageusia/anosmia is currently increased because of COVID-19 compared to 2017-2019.

For Multisystem inflammatory syndrome, the upper level of the 95% CI exceeds 1 for the cumulative and interval 21-day risk windows. Multisystem inflammatory syndrome is also a condition known to be associated with COVID-19. The MAH's COVID-19 vaccine requires two doses spaced 21 days apart before achieving maximum effectiveness. It is possible that COVID-19 may occur within the 21-day window between doses. Contemporaneous background rates of multisystem inflammatory syndrome are likely to be increased due to COVID-19 compared to the 2017-2019 data used for the background rate.

The MAH will continue to seek more contemporaneous rates of events associated with COVID-19.

### **2.8.3. Acute disseminated encephalomyelitis, Guillain-Barré syndrome, myasthenia gravis, polyneuropathy, and transverse myelitis**

For ADEM, Guillain-Barré syndrome, myasthenia gravis, polyneuropathy, and transverse myelitis, the upper level of the 95% CI exceeds one for at least one of the risk windows in at least one of the risk periods, suggesting the possibility that the true O/E ratio may exceed one.

The ADEM O/E signal is new this month, following the adoption of the ACCESS narrow background rate for ADEM, 0.10 per 100,000 person years<sup>7</sup>, which is less than the rate of 5.3 per 100,000 person years derived from the ADVANCE effort used on previous monthly reports<sup>11</sup>. Had the previously referenced rate of 5.3 per 100,000 person years been used, an estimated 180 cases would have been expected in the 21-day risk window for the interval compared to the 16 cases observed. The narrow ACCESS definition restricts to ADEM events exclusively, whereas the observed cases encompass all spontaneous reports of ADEM, encephalitis, encephalopathy, and encephalomyelitis. If the observed cases were restricted to only those reports of ADEM, there would be three and nine cases in the interval and cumulative periods, respectively (compared to 16 and 52). Using these observed case counts, the upper level of the 95% CI would still exceed one. For the next monthly report, the MAH will evaluate whether the 5.3 per 100,000 person years is a more appropriate benchmark for signal detection.

The O/E ratio for Guillain-Barre is modestly increased this month compared to last month, in part due to the adoption of a new background rate of 1.88 vs 2.0. MAH continues to regularly review this safety topic and will include a discussion in the SMSR as warranted.

Myasthenia gravis and transverse myelitis were previously found to have an upper limit of the 95% CI of O/E ratio greater than 1 and were reviewed in detail in the March 2021 SMSR; the signals were determined not to be validated. The O/E for myasthenia gravis is similar to or lower than the ratio reported previously. For transverse myelitis, the adoption of the ACCESS narrow background rate of 0.35 per 100,000 person years<sup>9</sup> this month, replacing the 0.97 per 100,000 person year<sup>11</sup> rate from the ADVANCE project used in the previous

monthly report, has resulted in a higher O/E ratio than in the previous SMSR. The O/E ratio for polyneuropathy this month is similar to the ratio reported in previous reports. An evaluation of polyneuropathy is found in [Appendix 3.2](#) of this current SMSR.

#### **2.8.4. Age and European Economic Area stratified analyses**

The MAH is aware of the EMA request for age-stratified observed versus expected analyses for European Economic Area (EEA) countries. The MAH acknowledges that it may be informative to look at the observed versus expected number within age stratum, as an excess risk might be specific to a particular stratum, and also recognizes the methodologic challenges associated with determining background rates and Comirnaty vaccine exposure within age strata (Mahaux, 2016)<sup>2</sup>.

ECDC is publicly reporting country-specific vaccination information; for some countries, this exposure information includes sufficient information to estimate person years of exposure by age strata, i.e., counts of Comirnaty vaccinated persons by age and by interval (e.g., weekly/daily). Additionally, the ACCESS project has generated age-specific rates for the events included in that protocol.

Beginning with the May 2021 SMSR #6, MAH will provide age-stratified O/E analyses for EEA countries, where feasible, based on availability of sufficient information to estimate age-stratified exposure. For O/E events included in Appendix 5.1 of the SMSR that demonstrate marked variability in the background rate by age group (as highlighted in the ACCESS draft interim report Table 3)<sup>25</sup>, the appropriate age-specific expected background rates will be multiplied by the age-specific exposure and used to generate the expected counts. For events that do not demonstrate marked variability by age, country-age-stratified expected counts will be generated using the overall rate. Where feasible, the MAH will determine O/E ratios pooling countries with similar age categories rather than provide country specific results.

##### **2.8.4.1. Age-stratified death analysis**

Vaccination administrations were assumed to be evenly split between the 18-64 year and 65+ years age groups.

**Table 4. Age-Stratified Observed to Expected (O/E) Ratios of Death**

Age group	21-Day Risk Window, Cumulative		No Risk Window, Cumulative		21-Day Risk Window, Interval		No Risk Window, Interval	
	O/E Ratio	95% CI	O/E Ratio	95% CI	O/E Ratio	95% CI	O/E Ratio	95% CI
18-64 years	0.015	0.013, 0.016	0.005	0.005, 0.006	0.017	0.014, 0.020	0.015	0.012, 0.018
65+ years	0.012	0.011, 0.012	0.004	0.004, 0.004	0.010	0.009, 0.011	0.009	0.008, 0.010

**Table 5. Age-Stratified Observed versus Expected Analyses of Death Inputs**

Age group	Background Rate per 100,000 Person Years (PY) <sup>26</sup>	Observed Cases, Cumulative <sup>a</sup>	Expected Cases, Cumulative, 21-Day Risk Window <sup>b</sup>	Expected Cases, Cumulative, No Risk Window <sup>c</sup>	Observed Cases, Interval <sup>a</sup>	Expected Cases, Interval, 21-Day Risk Window <sup>d</sup>	Expected Cases, Interval, No Risk Window <sup>e</sup>
18-64 years	3.50	289	19,773.7	53,166.7	99	5,930.6	6,740.6
65+ years	39.60	2,588	223,958.6	602,171.2	686	67,170.8	76,344.3

- a. Excludes 2 cases initially reported as age <18 believed to be invalid
- b. 5,656,092 PY
- c. 15,207,879 PY
- d. 1,696,403 PY
- e. 1,928,082 PY

The upper level of the 95% CI is substantially less than one for both the 18-64 year and 65+ years age groups across both risk windows and risk periods, thus there is no evidence of a signal for increased risk of death within either age category.

### **2.8.5. Limitations**

There are several limitations to observed to expected analyses for signal detection. The observed case counts are likely to be underestimated due to underreporting that occurs with spontaneous report surveillance. Additional reasons for underestimations include incomplete reporting and lags in reporting. Spontaneous surveillance systems are prone to reporting bias whereby events that have been previously identified as potentially related to vaccine are more likely to be reported even if they do not meet the clinical definition. Conversely, events that have not been previously associated with a vaccine are more likely to be underreported due to lack of recognition of a potential association.

With respect to the expected case counts, estimates of both exposure to vaccine and the background rate have limitations. The exposure estimate assumes that the number of reported vaccine administrations is complete and accurate when in fact not all countries administering vaccine have reported to the data source. Thus, the exposure is underestimated.

The expected count also assumes that the expected incidence rate in the vaccinated population is the same as that in the population used to calculate the background rate. The background rates used in this analysis are derived from one large US electronic health records database, one large US insurance claims database, EU health care systems, or regional studies published in the literature, and the majority of exposure data derive from the US. However, it is possible that the delivery of health care, population demographics, and underlying health status of the US populations used for the background rate estimates differ from those expected in the vaccinated population.

A final limitation concerns the risk window, the period during which one is expected to be at risk of a given event if there is a causal association between the event and the vaccine. Two periods, 21 days and no risk window, were selected to provide an estimate assuming a more acute onset (21-day window) and a more latent onset (no risk window). The 21-day risk window is particularly conservative as all observed cases are included in the numerator of the O/E ratio regardless of the days since vaccination dose, which will lead to an overestimation of the ratio if observed cases occurred outside of the risk window.

## **2.9. OBSERVED VERSUS EXPECTED ANALYSES FOR ANAPHYLAXIS (IDENTIFIED RISK)**

Since anaphylaxis has already been identified as a risk, the goal of the observed versus expected analysis is risk estimation rather than signal identification. Risk of anaphylaxis is reported per dose administered and compared to rates of anaphylaxis observed for other vaccines rather than rates in an unexposed population.

The MAH has conducted unadjusted observed versus expected analyses after reviewing the 4,286 cumulative cases of anaphylaxis occurring outside of a clinical trial setting reported in the global safety database through 29 April 2021. Anaphylaxis cases were identified using

the MedDRA version 23.1 SMQ anaphylactic reaction broad algorithm and then limited to cases presenting any symptom on day 0 (vaccination day). Cases assessed as Brighton Collaboration Levels 1-2 (N=1,851) were included in the analysis. A background rate<sup>27</sup> of 1.31 anaphylaxis cases per million vaccine doses was assumed.

An estimated 332,738,172 doses of Pfizer-BioNTech COVID-19 vaccine have been administered through 29 April 2021. Approximately 80% of shipped doses of the Pfizer-BioNTech COVID-19 vaccine are administered in the European Union and the United States. This administration estimate was applied to the 415,922,715 doses shipped worldwide through 29 April 2021.

Expected counts were determined by multiplying the number of doses administered by the expected rates per dose.

An O/E ratio of 4.247 (95% CI 4.055, 4.444) was observed for BNT162b2 compared to the background rate for anaphylaxis cases observed in the US. This rate has declined from the 5.12 (95% CI 4.85, 5.41) reported in SMSR 4 (through 31 March 2021), the 7.76 (95% CI 7.22, 8.33) reported in SMSR 3 (through 28 February 2021) and the 9.47 (95% CI, 8.61, 10.40) reported in SMSR 2 (through 31 January 2021). The reason for the decline is unknown but could reflect decreased reporting, changes in the accuracy of the exposure estimate, or changes in population being vaccinated.

There are several limitations to consider when interpreting these analyses. The analyses did not adjust for differences in characteristics such as age and comorbidities between persons being administered the vaccine and populations from which the background rate was derived. The spontaneous report system likely underestimates the true number of observed events in vaccinated persons due to incomplete or a lag in reporting.

Conversely, spontaneous report systems are prone to reporting bias whereby events that have been previously identified as potentially related to a vaccine are more likely to be reported than other events, for example, due to increased media attention. With respect to the expected case counts, estimates of both exposure to vaccine and the background rate have limitations. The exposure estimate assumes that 80% of all shipped doses are administered in each country. The true number of vaccines administered may be higher or lower than this estimate.

Additionally, there are differences in health care delivery, demographics, and underlying health status in the populations used to calculate background rate estimates compared to those in the population administered the vaccine.

## **APPENDIX 6. LITERATURE REVIEW IN THE REPORTING PERIOD (METHODOLOGY)**

A web-based literature review service is used to review medical literature from clinical and non-clinical literature sources for significant safety information relevant to authorized Pfizer medicinal product including reviews and practice guidelines.

The following bibliographic databases are searched in this order:

1. MEDLINE®
2. Embase

Each search uses controlled vocabulary terms that are unique to each database. For each database, the search focuses on the following:

- AEs, effects and outcomes
- Generic name of the drug
- Prenatal and perinatal exposure and exposure through breast milk
- Drug interactions
- Clinical studies
- Epidemiology and meta-analyses
- Poisoning and toxicity
- Drug resistance and drug tolerance
- Toxicity tests

Searches are limited by date and by literature type. Editorials, and news reports (i.e., works consisting of an announcement or statement of recent or current events of new data and matters of interest in the field of medicine or science) are excluded because they are not peer-reviewed.

## APPENDIX 7. OVERVIEW OF INTERVAL CASES NOT INCLUDED IN THE APRIL 2021 SMSR

Among cases received or downloaded to the safety database during the Summary Monthly Safety Report (SMSR) reporting period, only those having a complete workflow cycle in the safety database (meaning they progressed to Distribution or Closed workflow status at least once) are included in that month's SMSR. This approach prevents the inclusion of cases that are not fully processed hence not accurately reflecting final data. As per monthly routine process, Pfizer applies a Late condition process that retrieves from the global safety database cases received but not captured in the previous month's SMSR due to lack of completeness. This condition ensures that no relevant cases are excluded from the SMSRs over time.

For the reporting period 01 April 2021 to 29 April 2021, there was a total of 59,048 case reports retrievable from the global safety database based on the Initial Safety Receipt Date; 45,874 case reports out of the 59,048 retrieved did not meet the defined criteria for inclusion in the April's SMSR and therefore are not included in the current SMSR.<sup>i</sup>

The table below presents the most frequently reported events by SOC and by PT for events reported in (≥1%) of the cases not included in the current SMSR.

### Events Reported in ≥1% in Cases\* not Included in the 5<sup>th</sup> SMSR

MedDRA SOC MedDRA PT	01 April 2021 Through 29 April 2021 AEs (AERP%) N = 45,874
<b>Blood and lymphatic system disorders</b>	
Lymphadenopathy <sup>a</sup>	1851 (4.03%)
<b>Cardiac disorders</b>	
Palpitations	500 (1.09%)
<b>Ear and labyrinth disorders</b>	
Tinnitus <sup>c</sup>	487 (1.06%)
Vertigo	464 (1.01%)
<b>Gastrointestinal disorders</b>	
Nausea <sup>a</sup>	3811 (8.31%)
Diarrhoea <sup>a</sup>	1484 (3.23%)
Vomiting <sup>a</sup>	1211 (2.64%)
<b>General disorders and administration site conditions</b>	
Pyrexia <sup>a</sup>	10252 (22.35%)
Vaccination site pain <sup>a</sup>	6723 (14.66%)
Fatigue <sup>a</sup>	6456 (14.07%)
Chills <sup>a</sup>	5132 (11.19%)
Malaise <sup>a</sup>	4600 (10.03%)
Pain <sup>a</sup>	3072 (6.70%)
Injection site pain <sup>a</sup>	1927 (4.20%)
Asthenia <sup>d</sup>	1715 (3.74%)
Vaccination site swelling <sup>a</sup>	1473 (3.21%)
Influenza like illness	1134 (2.47%)
Feeling abnormal	896 (1.95%)
Swelling <sup>c</sup>	788 (1.72%)
Feeling hot <sup>c</sup>	524 (1.14%)
Feeling cold <sup>c</sup>	508 (1.11%)
Chest pain	458 (1.00%)

**Events Reported in ≥1% in Cases\* not Included in the 5<sup>th</sup> SMSR**

MedDRA SOC MedDRA PT	01 April 2021 Through 29 April 2021 AEs (AERP%) N = 45,874
<b>Infections and infestations</b>	
Herpes zoster <sup>c</sup>	568 (1.24%)
<b>Injury, poisoning and procedural complications</b>	
Circumstance or information capable of leading to medication error <sup>b</sup>	507 (1.11%)
<b>Musculoskeletal and connective tissue disorders</b>	
Myalgia <sup>a</sup>	6285 (13.70%)
Arthralgia <sup>a</sup>	4732 (10.32%)
Pain in extremity <sup>a</sup>	3387 (7.38%)
Back pain	630 (1.37%)
<b>Nervous system disorders</b>	
Headache <sup>a</sup>	9838 (21.45%)
Dizziness <sup>d</sup>	2284 (4.98%)
Paraesthesia <sup>d</sup>	945 (2.06%)
Hypoesthesia	862 (1.88%)
Somnolence	493 (1.07%)
<b>Psychiatric disorders</b>	
Insomnia <sup>e</sup>	498 (1.09%)
<b>Respiratory, thoracic and mediastinal disorders</b>

Rash <sup>a</sup>	1457 (3.18%)
Erythema <sup>a</sup>	990 (2.16%)
Urticaria <sup>a</sup>	860 (1.87%)
Hyperhidrosis <sup>d</sup>	550 (1.20%)

- a. Listed or consistent with listed AEs in current RSI;
  - b. Listed per case processing convention;
  - c. Consistent with anaphylactic reactions listed in the current RSI;
  - d. Evaluated to be risks (not important) and will be added to the RSI;
  - e. Evaluated and determined not to be a risk;
- \* Reporting proportion (% of total cases) in the current reporting period.

Most of the frequently reported events are listed or consistent with listed events as per the current RSI or have undergone specific safety reviews.

<sup>i</sup> There was a total of 30,752 case reports included in the April's SMSR, of which 13,174 captured based on their Initial Safety Receipt Date and 17,578 case reports captured applying the Late condition.

## APPENDIX 8. Q&A SECTION – EMA PRAC REQUESTS FOR NEXT SMSR

### QUESTION 1

1. *In the exposure section of the MSSR the MAH is requested to provide:*
  - a. *the administrated doses of Comirnaty per region/country.*
  - b. *the total number of administered Comirnaty doses 1 and 2 in the EU/EEA, per country, by gender and by age group.*

#### Response:

Refer to [Section 5.1](#) Cumulative and Interval Exposure Data Worldwide and [Section 5.2](#) Cumulative and Interval Exposure Data in the EU.

Please note that the estimated administrated doses of Comirnaty per region/country were added in the relevant tables, and the total number of administered Comirnaty doses 1 and 2 in the EU/EEA, per country, and by age group was provided based on data available at <https://covid19-vaccine-report.ecdc.europa.eu/> (point 6).

Data by gender are not currently available, the MAH committes to provide them once a reliable source for them is available.

### QUESTION 2

*The MAH refers to quality issues with ACCESS data that are not further specified. The MAH is requested to clarify these quality issues.*

#### Response:

Through participation in an ACCESS scientific community call, MAH learned that ACCESS researchers were concerned that some rates reported in the 03 March 2021 results overestimated the background rates and that they should be used with caution for signal detection. The ACCESS study team has updated their rates using new algorithms for all endpoints as of 29 April 2021, in addition to other changes.<sup>1</sup> These background rates have been incorporated in the O/E analysis in this Monthly report.

### QUESTION 3

*MAHs' commitment to generate EEA geography specific O/E results based on age groups is noted. If possible the MAH should provide clear timelines, when this will be adequately addressed. It is reiterated that O/E analysis stratified by age should be provided for events with background incidences that vary according to age (e.g. GBS, thromboembolic events, myocarditis, Herpes zoster). Moreover, in case estimations are used, sensitivity analyses should be provided, considering uncertainties/factors such as underreporting.*

---

<sup>1</sup> [http://www.encepp.eu/documents/ACCESS\\_Report\\_BGR\\_20210430\\_v.1.2.pdf](http://www.encepp.eu/documents/ACCESS_Report_BGR_20210430_v.1.2.pdf).

**Response:**

The MAH acknowledges that it may be informative to look at the observed versus expected number within age stratum, as an excess risk might be specific to a particular stratum, and also recognizes the methodologic challenges associated with determining background rates and Comirnaty vaccine exposure within age strata (Mahaux,<sup>2</sup> 2016).

ECDC is publicly reporting country-specific vaccination information; for some countries, this exposure information includes sufficient information to estimate person years of exposure by age strata, i.e., counts of Comirnaty vaccinated persons by age and by interval (e.g., weekly/daily). Additionally, the ACCESS project has generated age-specific rates for the events included in that protocol.

Beginning with the May 2021 SMSR, MAH will provide age-stratified O/E for EEA countries, where feasible, based on availability of sufficient information to estimate age-stratified exposure. For O/E events included in Appendix 5.1 of the SMSR that demonstrate marked variability in the background rate by age group (as highlighted in the ACCESS draft interim report Table 3<sup>1</sup>), the appropriate age-specific expected background rates will be multiplied by the age-specific exposure and used to generate the expected counts. For events that do not demonstrate marked variability by age, country-age-stratified expected counts will be generated using the overall rate. Where feasible, MAH will determine O/E pooling countries with similar age categories rather than provide country specific results.

**QUESTION 4**

*The MAH is requested to continue to indicate in future MSSRs what proportion of EV cases with availability data before DLP is not included in future MSSRs. While the MAH states that the processing of serious cases, including fatal and life-threatening reports and serious AESIs, is prioritised, it is unclear whether all SAE and AESI cases have been included in the current MSSR. This should be clarified in future MSSRs.*

**Response:**

As per data (as of 30 April 2021), of the 15,937 cases downloaded from EudraVigilance for the period covered by the fifth SMSR, 3,573 cases (22.4 % of the total downloaded cases) are included in the dataset reviewed in the SMSR.

Of the 3,573 cases included, 3,374 are serious.

For the 12,364 cases from EudraVigilance downloaded in April 2021 but not included in the report, there are 10,297 non-serious cases and 2,067 serious cases.

Of note, the serious cases not included are those downloaded in April 2021 not fully processed in time to be included in the April 2021 SMSR, however, these reports are being

---

<sup>2</sup> <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5063172>.

processed within required timelines and they will be included in the subsequent May 2021 SMSR.

### QUESTION 5

*The MAH is requested to retrieve the outcomes of reported medication error events as much as possible or provide a discussion to justify the low numbers of known medication error event outcomes.*

#### Response:

As per *Good practice guide medication error recording coding reporting assessment (27 November 2015 europa.eu)*, patient outcome is not applicable for the medication error itself as the patient cannot recover from the error, only from the clinical consequence(s). The outcome of medication errors is “Unknown” unless the Medication error event is associated with an AE, at which point the outcome of the associate AE is followed-up. Of note, the most severe outcome is selected if multiple associated AEs are reported.

### QUESTION 6

*The MAH is requested to discuss if the findings of the paper of Krammer et al. (<https://www.medrxiv.org/content/10.1101/2021.01.29.21250653v1.full-text>) identifies new safety information, or otherwise justify or confirm that the findings in this paper do not identify any new safety information.*

#### Response:

Refer to [Section 9.1 Literature Review](#).

### QUESTION 7

*The MAH should provide additional (follow-up) information of:*

- a. case (b) (6) (Female 39 years-of-age. PTs: Thrombocytopenia, Cerebrovascular accident, Cerebral haemorrhage) lack of documented medical history, possible risk factors or concomitant medication precludes full causality assessment.
- b. case (b) (6) (56-year-old male. PTs: Cerebral haemorrhage, Immune thrombocytopenia, Haemorrhage intracranial, Haemorrhagic stroke) causality cannot be excluded and is possible due to the absence of risk factors.

#### Response:

Follow-up attempts for case (b) (6) were completed on 18 Mar 2021 and no past medical history was able to be obtained. Follow-up attempts for case (b) (6) were completed on 06 May 2021. Most of the information in the case appears to be from social media platforms. Per one reporter: “The medical examiner's report said there wasn't enough evidence to show whether the vaccine contributed to patient death. Given the history, autopsy, toxicology, and laboratory findings, the cause of death is complications of immune

thrombocytopenia following receipt of SARS-COV-2 vaccine," the report said. "Based on the circumstances as currently known, the manner of death is natural."

### QUESTION 8

*In EudraVigilance (EV gateway date 26 Jan 2021 until 06 April 2021) 16 additional CVST cases have been reported. In one case (b) (6) CVST was coreported with Contusion, Immune thrombocytopenia, Platelet count decreased, Rectal haemorrhage. In 15 out of 16 cases CVST was not reported in combination with thrombocytopenia. Consequently, these additional cases do not alter the current assessment conclusions. In addition, EMA conducted an EV query on TTS with cut-off 13 Apr 2021, which is included in ANNEX 6. The MAH is requested to discuss these cases, focusing on cases suggestive of thrombosis in combination with thrombocytopenia, if applicable.*

#### Response:

Refer to [Appendix 3.8](#) Summary of Cases of Thromboembolism with Thrombocytopenia.

### QUESTION 9

*The MAH is requested to report the results of the review of Polyneuropathy cases as this was considered a non-validated safety signal.*

#### Response:

Refer to [Appendix 3.2](#) for evaluation of Polyneuropathy.

### QUESTION 10

*The MAH is requested to report the results of their ongoing reviews of:*

- a. Hepatic events;*
- b. Seizure;*
- c. Herpes zoster (age-stratified O/E analyses should be presented by the MAH as part of the evaluation of this topic).*

*If results are not available yet, clear timelines should be provided.*

#### Response:

Refer to:

- [Appendix 3.1](#) for evaluation summary of Hepatic events;
- [Appendix 3.4](#) for evaluation of Seizure;
- [Appendix 3.3](#) for evaluation of Herpes zoster.

## QUESTION 11

*The MAH is requested to evaluate the safety topic of myocarditis and pericarditis and provide a cumulative review of myocarditis and pericarditis, from all available sources. In the cumulative review, the MAH should provide at least but not limited to the following:*

- *A tabulated overview of all cases, stratified by*
  - 1) *Age;*
  - 2) *Gender;*
  - 3) *Time-to onset;*
- *A summary overview of the serious cases*
  - 1) *for which the causality (as per WHO-UMC causality assessment system) is considered at least possible or probable; and*
  - 2) *for which the role of the vaccine cannot be excluded.*

*The summary overview should include the following details for each case:*

- Patient's age and gender;*
- EVDAS/EudraVigilance case ID;*
- Associated clinical signs/co-reported PTs;*
- Any underlying condition(s) (including COVID-19) or other confounders;*
- Time to onset, and whether following the 1st or 2nd dose;*
- Outcome;*
- Assessment of the causal relationship with the vaccine.*
- *Based on their review of the cases, the MAH should discuss any plausible mechanisms and whether any risk factors could be identified. In conclusion, the MAH should discuss the need to update the product information, including relevant risk minimisation measures.*

*Also, in the next MSSR, the MAH is requested to present more in-depth O/E analyses of AESIs Myocarditis and Pericarditis, including O/E analyses stratified by age and gender. The MAH should ensure that the most relevant background incidence rates are selected and used for comparison, e.g. based on the origin of the cases. A justification for the selected IR should be provided.*

### Response:

Refer to [Appendix 3.7](#) for evaluation of Myocarditis and Pericarditis.

## QUESTION 12

*A signal on Appendicitis has been identified by UMC based on data in the VigiBase: Mitchell J et al Appendicitis and the Covid-19 Vaccines, April 2021. The authors have identified 43 cases – 30 for Comirnaty and 13 for the Covid-19 Vaccine Moderna. The MAH is requested to comment on this signal.*

### Response:

Reports of appendicitis in Study C4591001 were closely followed throughout the study and were not determined to be a risk of the vaccine. Appendicitis has not emerged as a signal in post-authorization signal detection activities, however, the topic will be reviewed and discussed in the next SMSR #6 (covering the month of May 2021).

## QUESTION 13

*The MAH should provide a cumulative review of cases indicative of delayed onset skin reactions, including a discussion of the publication by Blumenthal et al.*

### Response:

The Blumenthal publication on delayed skin reactions following vaccination with the Moderna COVID-19 vaccine prompted the MAH to perform a cumulative review of cases indicative of delayed onset skin reactions reported in association with Pfizer/BNT COVID-19 Vaccine. This review was provided as an appendix in SMSR #4 (01 Mar 2021 – 31 Mar 2021) and concluded that the available data did not support a causal association between the vaccine and delayed skin reactions.

## QUESTION 14

*Regarding exposure during pregnancy, cumulative data and data occurring during the reporting interval should be made available in the framework of the next assessment report. Moreover, they should be presented accordingly to annex 3 of the “Guideline on the exposure to medicinal products during pregnancy: need for post-authorisation data (EMA/CHMP/313666/2005)”.*

### Response:

The MAH committes to provide requested data in the framework of the next assessment report.
