## EXECUTIVE SUMMARY

This is the 5<sup>th</sup> Summary Monthly Safety Report (SMSR) for PF-07302048 [Coronavirus disease 2019 (COVID-19) mRNA Vaccine, hereafter referred to as BNT162b2)], covering the reporting interval 01 April 2021 through 29 April 2021.

BNT162b2 is a white to off-white frozen dispersion (pH: 6.9 - 7.9), provided as concentrate for dispersion for injection (sterile concentrate) as multidose vial to be diluted before use. The multidose vial contains 6 doses of 0.3 mL after dilution; low dead-volume syringes and/or needles should be used in order to extract 6 doses from a single vial. The low dead-volume syringe and needle combination should have a dead volume of no more than 35 microlitres. If standard syringes and needles are used, there may not be sufficient volume to extract a sixth dose from a single vial. Each dose contains 30 micrograms of BNT162b2 embedded in lipid nanoparticles (LNPs). The vaccine also contains (4-hydroxybutyl)azanediylbis(hexane-6,1-diyl)bis(2-hexyldecanoate) (ALC-0315), 2-[(polyethylene glycol)-2000]-N,N-ditetradecylacetamide (ALC-0159), 1,2-Distearoyl-sn-glycero-3-phosphocholine (DSPC), cholesterol, potassium chloride, potassium dihydrogen phosphate, sodium chloride, disodium hydrogen phosphate dihydrate, sucrose and water for injections as excipients.

BNT162b2 is highly purified single-stranded, 5'-capped mRNA produced using a cell-free in vitro transcription from the corresponding DNA templates, encoding the viral spike (S) protein of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2). The nucleoside-modified mRNA is formulated in LNPs, which enable delivery of the RNA into host cells to allow expression of the SARS-CoV-2 S antigen. The vaccine elicits both neutralizing antibody and cellular immune responses to the spike (S) antigen, which may contribute to protection against COVID-19.

BNT162b2 is indicated for active immunisation to prevent COVID-19 caused by SARS-CoV-2 virus, in individuals 16 years of age and older.<sup>5</sup> No dosage adjustment is required in elderly individuals  $\geq 65$  years of age. It is administered intramuscularly in the deltoid muscle after dilution as a series of 2 doses (0.3 mL each) at greater than or equal to 21 days (preferably 3 weeks) apart.

It is estimated that approximately 415,922,715 doses of BNT162b2 were shipped worldwide from the receipt of the first temporary authorisation for emergency supply on 01 December 2020 through 29 April 2021 and that approximately 172,777,410 doses of BNT162b2 were shipped worldwide during the current reporting interval from 01 April 2021 through 29 April 2021. Estimated worldwide shipped doses may serve as a reasonable indicator of subject exposure, considering that approximately 80% of the shipped doses were

---

<sup>5</sup> Please note that after the data-lock point of this report, respectively on 05 May 2021 and on 10 May 2021, BNT162b2 was authorized for use in individuals 12 years of age and older in Canada and in the US. Variation 0030 (EMA/H/C/005735/II/0030) has been also submitted to EMA on 30 April 2021 to seek expansion of the indication to subjects 12 to 15 years of age. The relevant procedure is currently ongoing.

administered; this estimation is based on the proportion of doses administered out of those shipped upon review of data currently available for the EU<sup>6</sup> countries and the US.<sup>7</sup>

It is estimated that approximately (b) (4) doses of BNT162b2 were shipped in the EU from the receipt of the first conditional marketing approval authorisation on 21 December 2020 through 29 April 2021 and that approximately (b) (4) doses of BNT162b2 were shipped in the EU during the current reporting interval from 01 April 2021 through 29 April 2021.

BNT162b2 has received temporary authorisation for emergency supply in 32 countries and conditional marketing authorisation approval in 42 countries globally.

There were no authorisation withdrawals for safety reasons during the reporting interval.

During the reporting period, no actions have been taken with respect to BNT162b2 for safety reasons, either by a Health Authority or by the MAH.

The Reference Safety Information (RSI) for this SMSR is the BNT162b2 Core Data Sheet (CDS) Version 3.0, dated 20 April 2021, in effect at the end of the reporting period. The previous CDS Version 2.0, dated 02 March 2021, was also in effect during the reporting period, and was updated on 20 April 2021 due to planned data analysis from the ongoing multi-country clinical trial, C4591001, on adolescent study participants 12 through 15 years of age. As a result, a summary of the safety profile in the adolescents 12 through 15 years of age was added in Section 4.8 Undesirable effects.

During the reporting period, the following signals were addressed:

1. Asthenia, lethargy, decreased appetite, hyperhidrosis, night sweats were evaluated to be risks (not important for the purpose of inclusion in the Risk Management Plan or Pharmacovigilance Plans) and will be added to the RSI and subsequently to the local product labels;
2. Herpes Zoster including Ophthalmic Herpes Zoster was evaluated and determined not to be a risk;
3. Seizure was evaluated and determined not to be a risk;
4. Myocarditis and Pericarditis were evaluated and determined not to be risks.

---

<sup>6</sup> This proportion has been calculated considering, out of total number of vaccine doses distributed in the EU-EEA countries, the total number of vaccine doses administered as per report on <https://qap.ecdc.europa.eu/public/extensions/COVID-19/vaccine-tracker.html#distribution-tab>, as of 01 May 2021.

<sup>7</sup> This proportion has been calculated considering, out of total number of vaccine doses distributed in the US, the total number of vaccine doses administered as per report on <https://covid.cdc.gov/covid-data-tracker/#vaccinations>, as of 30 April 2021.

During the reporting period, the following safety topics were addressed and determined not to be validated signals:

1. Cranial nerve palsy;
2. Hemolytic anemia;
3. Hepatic events;
4. Nephrotic syndrome;
5. Optic neuritis;
6. Trigeminal neuralgia.

Based on the new safety and efficacy/effectiveness data from the reporting interval for BNT162b2, the benefit-risk profile of BNT162b2 remains favorable.

## 1. INTRODUCTION

This is the 5<sup>th</sup> SMSR for PF-07302048 (COVID-19 mRNA Vaccine, hereafter referred to as BNT162b2), covering the reporting interval 01 April 2021 through 29 April 2021. The format and content of this SMSR is in accordance with the EMA coreRMP19 Guidance (EMA/544966/2020) and, as applicable, with ICH Guideline E2C (R2) Periodic Benefit-Risk Evaluation Report [Step 5, January 2013] considering the information for the evidence from post-EUA/conditional marketing authorisation approval data sources.

BNT162b2 is a white to off-white frozen dispersion (pH: 6.9 – 7.9), provided as concentrate for dispersion for injection (sterile concentrate) as multidose vial to be diluted before use. The multidose vial contains 6 doses of 0.3 mL after dilution; low dead-volume syringes and/or needles should be used in order to extract 6 doses from a single vial. The low dead-volume syringe and needle combination should have a dead volume of no more than 35 microlitres. If standard syringes and needles are used, there may not be sufficient volume to extract a sixth dose from a single vial. Each dose contains 30 micrograms of BNT162b2 (embedded in LNPs). The vaccine also contains ((4-hydroxybutyl)azanediyl)bis(hexane-6,1-diyl)bis(2-hexyldecanoate) (ALC-0315), 2-[(polyethylene glycol)-2000]-N,N-ditetradecylacetamide (ALC-0159), 1,2-Distearoyl-sn-glycero-3-phosphocholine (DSPC), cholesterol, potassium chloride, potassium dihydrogen phosphate, sodium chloride, disodium hydrogen phosphate dihydrate, sucrose and water for injections as excipients.

BNT162b2 is highly purified single-stranded, 5'-capped mRNA produced using a cell-free in vitro transcription from the corresponding DNA templates, encoding the viral spike (S) protein of SARS-CoV-2. The nucleoside-modified mRNA is formulated in LNPs, which enable delivery of the RNA into host cells to allow expression of the SARS-CoV-2 S antigen. The vaccine elicits both neutralizing antibody and cellular immune responses to the spike (S) antigen, which may contribute to protection against COVID-19.

BNT162b2 is indicated for active immunization to prevent COVID-19 caused by SARS-CoV-2 virus, in individuals 16 years of age and older.<sup>5</sup> No dosage adjustment is required in elderly individuals  $\geq 65$  years of age. It is administered intramuscularly in the deltoid muscle after dilution as a series of 2 doses (0.3 mL each) at greater than or equal to 21 days (preferably 3 weeks) apart.

Pfizer is responsible for the preparation of the SMSR on behalf of the MAH BioNTech according to the Pharmacovigilance Agreement in place. Data from BioNTech are included in the report when applicable.

A complete list of the finalized SMSRs is provided in Table 1 below.

**Table 1. List of SMSRs**

SMSR Number	Reporting Period
1	01 December 2020 through 31 December 2020
2	01 January 2021 through 31 January 2021
3	01 February 2021 through 28 February 2021
4	01 March 2021 through 31 March 2021

## 2. WORLDWIDE APPROVAL OR AUTHORISATION STATUS

BNT162b2 received first temporary authorisation for emergency supply under regulation 174 in the UK<sup>8</sup> on 01 December 2020 and is currently authorised for emergency use in 32 countries.

BNT162b2 received first regulatory conditional marketing authorisation approval in Switzerland on 19 December 2020 and is currently conditionally approved in 42 countries (including EEA).

Details of the current authorisation/approval status are presented in [Appendix 4](#).

## 3. ACTIONS TAKEN IN THE REPORTING INTERVAL FOR SAFETY REASONS

During the reporting period, no actions have been taken with respect to BNT162b2 for safety reasons, either by a HA or by the MAH.

There were no authorisation withdrawals for safety reasons during the reporting interval.

## 4. CHANGES TO REFERENCE SAFETY INFORMATION

The RSI for this SMSR is the BNT162b2 CDS Version 3.0, dated 20 April 2021, in effect at the end of the reporting period which is located in [Appendix 1](#).

The previous CDS Version 2.0, dated 02 March 2021, was also in effect during the reporting period, and it was updated on 20 April 2021 due to planned data analysis from the ongoing multi-country clinical trial, C4591001, on adolescent study participants 12 through 15 years of age. As a result, a summary of the safety profile in the adolescents 12 through 15 years of age was added in Section 4.8 Undesirable effects. The summary of the safety-related changes made is presented in [Appendix 1.1](#).

## 5. ESTIMATED EXPOSURE AND USE PATTERNS

### 5.1. Cumulative and Interval Exposure Data Worldwide

It is not possible to determine with certainty the number of individuals who received BNT162b2 during the period of this review. Estimated worldwide shipped doses may serve as a reasonable indicator of subject exposure, considering that approximately 80% of the shipped doses were administered; this estimation is based on the proportion of doses administered out of those shipped upon review of data currently available for the EU<sup>6</sup> countries and the US.<sup>7</sup>

---

<sup>8</sup> Upon that on 22 April 2021 conditional marketing authorisation approval was also granted in the UK, both the authorisation for emergency supply under regulation 174 and the conditional marketing authorization approval are currently active.

With these caveats in mind, it is estimated that:

- approximately 415,922,715 doses of BNT162b2 were shipped worldwide from the receipt of the first temporary authorisation for emergency supply on 01 December 2020 through 29 April 2021, corresponding to 332,738,172 estimated administered doses;
- approximately 172,777,410 doses of BNT162b2 were shipped worldwide during the current reporting interval from 01 April 2021 through 29 April 2021, corresponding to 138,221,928 estimated administered doses.

The estimated cumulative number of shipped and administered doses of BNT162b2 by region<sup>9</sup> based on data provided in the shipment tracker (b) (4),<sup>10</sup> from the receipt of the first temporary authorisation for emergency supply on 01 December 2020 through 29 April 2021, are summarized in Table 2.

- a. In this Region BNT162b2 was conditionally approved;
- b. In the UK, both the authorisation for emergency supply under regulation 174 and the conditional marketing authorisation approval are currently active for BNT162b2;
- c. Includes Albania where BNT162b2 was conditionally approved, Serbia where it received authorization for emergency supply, Bosnia where it was shipped for COVAX, North Macedonia where it was shipped for a non-COVAX agreement, and Turkey where it was shipped according to a manufacturing and supply agreement in place by the MAH and the Turkish government;
- d. Includes Georgia, Moldova and Ukraine; in these countries BNT162b2 was shipped for COVAX;
- e. In this Region BNT162b2 received authorization for emergency supply;
- f. Includes Chile, Colombia, Costa Rica, Ecuador, Mexico, Panama, Peru and Uruguay where BNT162b2 received authorisation for emergency supply (some doses in Colombia and Peru were also shipped for COVAX), Brazil where BNT162b2 was conditionally approved, and Bolivia and El Salvador where BNT162b2 was shipped for COVAX;
- g. Includes Bahrain, Iraq, Israel, Jordan, Kuwait, Lebanon, Oman, Qatar, Saudi Arabia, Singapore, United Arab Emirates where BNT162b2 received authorization for emergency supply, Malaysia and South Korea where BNT162b2 was conditionally approved (some doses in South Korea were also shipped for COVAX), and West Bank & Gaza, Maldives and Mongolia where BNT162b2 was shipped for COVAX;
- h. Includes Cape Verde, Rwanda and Tunisia where BNT162b2 was shipped for COVAX and South Africa where BNT162b2 received authorization for emergency supply.

**5.2. Cumulative and Interval Exposure Data in the EU**

Estimated shipped doses in the EU-EEA countries may serve as a reasonable indicator of subject exposure in these countries, considering that approximately **(b) (4)** % of the shipped doses were administered; this estimation is based on the proportion of doses administered out of those shipped upon review of data currently available for the EU<sup>6</sup> countries.

With these caveats in mind, it is estimated that:

- approximately **(b) (4)** doses of BNT162b2 were shipped in the EU-EEA countries from the receipt of the first conditional marketing authorisation approval on 21 December 2020 through 29 April 2021, corresponding to 97,504,368 estimated administered doses;

- approximately (b) (4) doses of BNT162b2 were shipped in the EU-EEA countries during the current reporting interval from 01 April 2021 through 29 April 2021, corresponding to 43,979,832 estimated administered doses.

Table 4 provides the estimated interval/cumulative number of shipped doses of BNT162b2 from the receipt of the first conditional marketing authorisation approval through 29 April 2021 for the 27 EU Countries and for the 3 EEA Countries.

## 6. DATA IN SUMMARY TABULATIONS

### 6.1. Reference Information

The MedDRA version 23.1 was used to code adverse events/reactions in summary tabulations.

### 6.2. Cumulative and Interval Summary Tabulations from Post-Marketing Data Sources<sup>13</sup>

- [Appendix 2](#) and [Appendix 2.1](#) respectively provide interval and cumulative numbers of case reports (serious and non-serious, medically confirmed and non-medically confirmed) received from post-marketing authorisation data sources,<sup>13</sup> overall, by sex, country, age groups and in special populations, and summary tabulations of events by PT and SOC respectively for the interval and cumulative periods.

The cumulative data include all data up to 29 April 2021 while the interval data are for the period from 01 April 2021 to 29 April 2021.

- [Appendix 2.2](#) provides an interval summary tabulation of case reports with DMEs from post-marketing data sources.<sup>13</sup>
- [Appendices 2.3](#) and [2.4](#) provide data stratified by country. In these appendices, spontaneous cases (including regulatory authority and literature cases) are presented separately from non-interventional cases:
  - [Appendix 2.3](#) provides a cumulative and interval summary tabulation of cases by medically confirmed and non-medically confirmed status (fatal, serious and non-serious).
  - [Appendix 2.4](#) provides a cumulative and interval summary tabulation of fatal cases.
- [Appendix 2.5](#) and [Appendix 2.6](#) provide a cumulative and interval summary tabulation of adverse reactions from post-marketing authorisation data sources<sup>13</sup> respectively by PT and by HLT organized according to SOC. Please refer to [Appendix 2.5.1](#)<sup>14</sup> and [Appendix 2.6.1](#)<sup>14</sup> for data per country.

Adverse events totals presented in [Appendix 2](#), [Appendix 2.1](#) and for safety topic evaluations in [Section 9.5](#) may differ from those presented in [Appendix 2.5](#) and [Appendix 2.6](#), due to the

---

<sup>13</sup> This refers to post-EUA/conditional marketing authorisation approval data sources. Only cases having a complete workflow cycle in the safety database (meaning that they went to Distribution or Closed workflow status at least once) have been included. This approach will prevent the inclusion of cases initially received and not fully processed since cases in early steps of the workflow process may still undergo changes and not accurately reflect final data. Each month, Pfizer applies a Late condition process that retrieves cases received in the reporting period but not included due to lack of completeness; this ensures no cases will be missed for inclusion in monthly reports.

<sup>14</sup> Due to a technical formatting issue, blank pages may be present in this Appendix; the total data are however correctly displayed.

fact that [Appendix 2.5](#) and [Appendix 2.6](#) only display the number of serious and non-serious reactions from spontaneous sources, serious reactions from non-interventional studies and from solicited sources as described above, whereas [Appendix 2](#), [Appendix 2.1](#) and the safety topic evaluations includes all reported events.

[Appendix 2.5.2](#),<sup>14</sup> [Appendix 2.5.3](#)<sup>14</sup> and [Appendix 2.5.4](#)<sup>14</sup> were added to include a cumulative and interval summary tabulation of adverse events from post-authorisation data sources<sup>13</sup> by PT per country, stratified respectively for age, gender and relevant co-morbidities.

Available relevant information with regard to the differences in vaccination prioritization in EU countries,<sup>15</sup> US<sup>16</sup>, UK and ROW<sup>17</sup> was taken into account in the evaluation of adverse events trends, clusters or signals.

## 7. MEDICATION ERRORS

Cases potentially indicative of medication errors<sup>18</sup> that occurred in the reporting period are summarized below.

- Number of cases: 1258 (4.1% of 30,752 cases, the total PM<sup>13</sup> dataset) of which 563 (44.8%) are medically confirmed, compared to 771 (2.6%) in the fourth monthly report of which 61.9% were medically confirmed. The increase in medication errors reported during this reporting period in comparison to the previous monthly report is mainly due to an approximate 5-fold increase in reported medication errors related to administration or scheduling of the second vaccine dose more than 21 days from the first vaccine dose as recommended in the RSI. In the majority of these medication errors, the reasons for administration or scheduling of the second vaccine dose more than 21 days from the first vaccine dose were not provided.
- Of the 1258 cases, 27 cases were determined to be non-contributory and are not included in the discussion for the following reasons:
  - No indication that a patient experienced an event with the vaccine in 11 cases;
  - Reporting information was not consistent for paediatric patients (e.g., height, weight, clinical details, etc. indicative of an adult patient) and did not meet the medication error criteria for product administered to patient of inappropriate age in 4 cases;
  - Off-label use rather than medication error was reported in 4 cases;
  - An unspecified number of individuals were described in 3 cases;
  - Unknown if any consumer received the vaccine in 2 cases;
  - Medication error-related events were related to concomitant medication and not the vaccine in 2 cases;
  - A medication error-related event was mistakenly coded in 1 case (i.e., case details on a US Federal Emergency Management Agency event for vaccine distribution was erroneously coded to the PT Product dispensing issue) and has been flagged for correction after the DLP;

- Number of relevant medication error cases: 1231  
Number of relevant events: 1437.
- Number of medication errors by country:
  - There were 202 cases describing medication errors that occurred in the EU/EEA countries [Germany (47), Belgium (37), Italy (19), Ireland (17), France (16), Spain (14), Netherlands, Romania (8 each), Sweden (6), Czech Republic, Hungary, Portugal (4 each), Norway, Poland (3 each), Austria, Denmark, Finland (2 each), Croatia, Cyprus, Greece, Liechtenstein, and Slovakia (1 each)].
  - There were 1029 cases with medication errors from non-EU/EEA countries [US (537), UK (431), Mexico (19), Japan (11), Canada (8), Switzerland (5), Israel (4), Chile, Turkey (3 each), Colombia (2), Australia, India, Puerto Rico, Serbia, Singapore, and United Arab Emirates (1 each)].

In some instances, clusters of medication errors were reported, generally by HCPs, suggesting that rather than a systematic issue worldwide, these errors were repeated mistakes at certain vaccination centres:

- In the EU/EEA region there were 3 clusters, the largest reported cluster was received from Belgium (112 cases);
  - In non-EU/EEA countries there were 13 clusters, the largest reported clusters were received from the US [(16 cases, 12 cases, and 11 cases (3 clusters)].
- Medication error PTs in the EU/EEA and non-EU/EEA countries:<sup>19</sup>
    - In the EU/EEA countries, a total of 272 PTs indicative of medication errors were reported; those events reported at least thrice included: Incorrect route of product administration (91), Wrong technique in product usage process (50), Inappropriate schedule of product administration (48), Poor quality product administered (25), Product preparation error (10), Incorrect dose administered (9), Product temperature excursion issue (7), Product preparation issue (5), Product administered at inappropriate site and Product storage error (4 each), and Underdose (3 each).<sup>20</sup>

---

<sup>19</sup> As per EMA assessment received on the first SMSR, the MAH was requested to keep medication errors under close scrutiny especially within the EU context and discuss whether the current product information is sufficiently clear or whether there is room for improvement. The Rapporteurs should be notified immediately in case of unexpected findings or trends.

<sup>20</sup> The PTs reported less than 3 times included: Accidental overdose (2), Accidental exposure to product, Circumstance or information capable of leading to medication error, Expired product administered, Exposure via skin contact, Inadequate aseptic technique in use of product, Incomplete course of vaccination, Incorrect product formulation administered, Medication error, Product administration error, Product dose omission issue, Product label confusion, Recalled product administered, Vaccination error, and Wrong product administered (1 each).

- In non-EU/EEA countries, a total of 1165 medication errors were reported; those events reported at least thrice included: Inappropriate schedule of product administration (559), Product preparation issue (103), Poor quality product administered (84), Circumstance or information capable of leading to medication error (58), Product temperature excursion issue (55), Incorrect route of product administration (39), Underdose (37), Product administered at inappropriate site, Product dose omission issue (34 each), Product preparation error (23), Expired product administered (21), Wrong technique in product usage process (19), Incorrect dose administered, Wrong product administered (18 each), Product storage error (17), Product administered to patient of inappropriate age (12), Accidental exposure to product, Incomplete course of vaccination (5 each), Counterfeit product administered<sup>21</sup>, Exposure via skin contact (4 each), Accidental overdose, and Product administration error (3 each).
- Medication errors by seriousness:
  - Serious (32 events of medication error):
    - Of these serious events of medication error, 5 serious medication errors<sup>22</sup> accompanied by clinical AEs were reported in EU/EEA countries [France (2), Belgium, Italy, and Slovakia (1 each)];
      - Seriousness criteria were medically significant events (4 events), hospitalization required, and disability (1 event each);
      - Of note, more than 1 serious criteria applied to 1 event;
      - All but 1 event were medically confirmed.
  - Non-serious (1405 events of medication error).

Please see the *Medication errors associated with harm* and *Medication errors without Harm* sections below for further details on co-reported AEs in cases involving serious medication error.

---

<sup>21</sup> In 2 of the 4 events, investigation by the MAH confirmed that the administered vaccine was falsified on the basis that the product deliberately or fraudulently misrepresents the identity, composition, or source. Follow up attempts for investigation of the remaining 2 events is not possible, and no further information is expected.

<sup>22</sup> PTs Inappropriate schedule of product administration (2), Incorrect route of product administration, Product administered at inappropriate site, and Product administration error (1 each).

## Medication Errors Harm Analysis

Among the medication error cases, the following scenarios, categorized according to the EMA guidance “Good practice guide on recording, coding, reporting and assessment of medication errors” (EMA/762563/2014) were described:

- Medication errors associated with harm [i.e., resulting in adverse reaction(s)] were reported in 34 cases (2.8% of relevant medication error cases) compared to 19 cases (2.6%) in the fourth SMSR;
- Medication errors without harm [i.e. not resulting in adverse reaction(s)]<sup>23</sup> were reported in 1157 cases (94.0% of relevant medication error cases), of which 652 cases involved co-reported AEs, compared to 696 cases (94.3%), of which 345 included co-reported AEs, in the fourth SMSR;
- Potential medication errors were reported in 46 cases (3.7% of relevant medication error cases) compared to 23 cases (3.1%) in the fourth SMSR.
- Similar to the fourth SMSR, intercepted medication errors were not reported during the reporting interval.

Of note, some cases involved more than one medication error.

### *Medication errors associated with harm (34 medication errors in 34 cases)*

There were 9 cases from the EU/EEA area [Germany (3), Belgium, Czech Republic, Italy, Ireland, Portugal, and Slovakia (1 each)] and 25 from non-EU/EEA countries [US (15), Japan (5), UK (4), and Mexico (1)].

### Serious medication errors

In 6 cases (involving 6 medication error events), serious medication errors potentially contributed to the occurrence of SAEs.

- Vaccination site hypoaesthesia [arm (unspecified)] and Hypoaesthesia [hand (unspecified)] (both serious) were reported in a 50-year-old man after receiving the vaccine that was described as being administered with improper injection technique leading to numbness (PT Wrong technique in product usage process). Numbness of the arm occurred on the day of vaccination, and numbness of the hand occurred about 5 days after vaccination. Additional SAEs in the same subject coded to the PTs Chills, Back pain, Vaccination site pain, Muscular weakness, and Myalgia were also reported and are considered related to the vaccine. Concomitant medications were not reported. At the time of the report, all SAEs were not resolved and the patient plans to seek further medical care.

---

<sup>23</sup> AEs may be co-reported in a case, but they are not considered to be a result of the medication error.

- Cervicobrachial syndrome and Brachial plexus injury (both serious) were reported in a 33-year-old woman approximately 2 days after receiving the vaccine that was possibly injected near a nerve in her arm (PT Product administration error). No remarkable findings were found on a magnetic resonance imaging scan of the affected arm. Treatment consisted of NSAIDs (unspecified), “tramadol-containing” pain medication and pregabalin along with supplements (benfotiamine and cyanocobalamin). Additional events of Peripheral swelling, Headache, Body temperature increased, Fatigue, and Face oedema (all non-serious) were also reported for this subject. Clinical outcomes for all events were unknown at the time of the report.
- Hypersensitivity, Palpitations, Chest discomfort, and Hypertension (all serious) occurred in a 50-year-old man a few minutes after receiving his second dose of vaccine that was reported as being expired (details not provided; PT Expired product administered). He was monitored and “everything went back to normal” a few minutes later. This description of events seems consistent with a vaccination stress reaction more so than a reaction due to an expired product. Medical history included suspected COVID-19 about 2 months prior to vaccination and tuberculosis diagnosed 6 years ago. All events were resolved.
- A 42-year-old woman reported experiencing Vaccination site lymphadenopathy (serious) described as “large swelling on her left armpit” after receiving “expired vaccine” (PT Expired product administered; details not provided). At the time of the report, the serious event was resolving. Of note, this case is not medically confirmed. The report AE in this case does not appear to be due to the administration of an expired product.
- A 44-year-old woman reported experiencing Vaccination site reaction, Vaccination site pain, Axillary pain, Breast pain, Myalgia, Fatigue, and Chills (all serious) after the vaccine was injected into her left bicep muscle (as reported) (PT Product administered at inappropriate site). All SAEs resolved 1 day after onset. Of note, this case is not medically confirmed.

#### Non-serious medication errors

In 29 cases (involving 29 medication error events), non-serious medication errors potentially contributed to the occurrence of non-serious AEs.

#### *Errors in the route of administration (9 events, 9 cases)*

- This error occurred in 3 cases from the EU/EEA area [Germany, Portugal, and Italy (1 each)] and in 6 cases from non-EU/EEA countries [Japan (4) and US (2)]. The vaccine was administered subcutaneously and intravenously (4 events each) and intradermally (1 event). Local vaccination site reactions mainly included erythema, pain and swelling. Additionally, in 2 of the 4 cases involving intravenous administration, non-serious events coded to the PTs Blood pressure increased and Oropharyngeal discomfort (1 event each) were reported. Outcomes for both events were unknown at the time of the report.

*Errors of vaccination at the wrong anatomical site (6 events, 6 cases)*

- This error occurred in 6 cases from the US. The vaccination was not administered in the deltoid muscle (PT Product administered at inappropriate site). When provided, the vaccination site was described as being the bicep muscle and the shoulder (not in the muscle) (2 cases each). Local vaccination site reactions included pain, mass, swelling, decreased mobility, and vaccination site haemorrhage.

*Incorrect interval between doses (4 events, 4 cases)*

- This error occurred in 1 case from the EU/EEA area (Germany) and in 3 cases from a non-EU/EEA country (US). In all 4 cases, the second vaccine dose was administered less than 21 days from the first vaccine dose and the dosing interval ranged from 10 to 17 days. Events of fatigue, chills, pain, myalgia, malaise, influenza-like illness, headache, and nausea were reported.

*Use in unauthorized individuals (2 events, 2 cases)*

- This error occurred in 2 cases from a non-EU/EEA country (UK). The vaccine was inadvertently administered to paediatric individuals below 16 years of age (see [Section 9.5.4 Use in Paediatric Individuals <16 Years of Age](#)) (2 events) with ages ranging from 1 to 2 months. Events of vaccination site erythema/pain, malaise, miliaria, and pain in extremity were reported.

*Error in vaccine dosage (2 events, 2 cases)*

- This error occurred in 2 cases from the EU/EEA area (Germany and Ireland), in which accidental overdose (unspecified) and 2 doses in 1 day were reported. Events of pallor, dizziness, chills, nausea, headache, and asthenia were reported.

*Errors in administration technique (2 events, 2 cases)*

- This error occurred in 2 cases from a non-EU/EEA country (US) and involved administration technique errors described as an artery injury from injection per the vaccinee (not medically confirmed) and administration of an additional dose due to leakage of the initial dose from an improperly secured needle. Reported events included arthralgia, pyrexia, and vaccination site haemorrhage.

*Incorrect dilution (2 events, 2 cases)*

- This error occurred in 1 case from the EU/EEA area (Czech Republic) and in 1 case from a non-EU/EEA country (US), in which a single vaccine dose was administered without performing the dilution in 1 case and dilution was performed with a smaller volume of normal saline in another case. Events of pyrexia, fatigue, asthenia, myalgia, pain, and vaccination site reaction were reported.

*Other vaccine administration errors (2 events, 2 cases)*

- This error occurred in 2 cases from non-EU/EEA countries (US and Mexico), in which expired vaccines were administered.<sup>24</sup> Reported events included pyrexia, headache, pain, sensitive skin, nausea, myalgia, muscle spasms, and feeling abnormal.

***Medication errors without harm (1357 medication errors in 1157 cases)***

These medication error PTs describe errors occurring during 1 or more steps of the vaccination process: preparation, administration, or scheduling of second dose.

Overall, there were

- 192 cases from the EU/EEA area: Germany (44), Belgium (36), Italy (17), France, Ireland (16 each), Spain (14), Netherlands, Romania (8 each), Sweden (6), Hungary, Czech Republic, Norway, Poland, Portugal (3 each), Austria, Denmark, Finland (2 each), Croatia, Cyprus, Greece, Liechtenstein, and Slovenia (1 each);
- 965 cases from non-EU/EEA countries: (those with more than 1 medication error) US (488), UK (427), Mexico (14), Canada (8), Japan (6), Switzerland (5), Israel (4), Chile, Turkey (3 each), and Australia (1).

*Vaccine preparation errors (246 events, all non-serious)*: Events mainly described errors during dilution (before use) or in storage conditions.

- *Incorrect dilution (137 events, all non-serious)*: Dilution was performed with a smaller volume of normal saline than instructed (85 events), a single vaccine dose was administered without dilution (17 events), dilution was performed with a larger volume of normal saline than instructed (16 events), vaccine was diluted with expired diluent (12 events), dilution was performed with sterile water for injection rather than normal saline (6 events), and a full vial of vaccine was administered without dilution (1 event).
- *Temperature excursion (83 events, all non-serious)*: In the majority of the events, the vaccine vials were either left in the refrigerator, in the freezer at a temperature range of -25°C to -15°C, or at room temperature for a longer time period than recommended in the RSI; no adverse events were reported upon vaccine administration.
- *Other preparation errors (26 events, all non-serious)*: In majority of the events, errors included vaccine doses prepared as prefilled syringes (5 events), only normal saline solution or expired vaccine<sup>25</sup> were pulled into the syringe for injection (5 events and 3

<sup>24</sup> In 1 case, vaccine that expired approximately 1 month prior to the administration date was injected into a patient. The second case did not provide details and was reported by the consumer as “maybe they gave me an expired dose” (note: this case is not medically confirmed).

<sup>25</sup> Vaccine was administered more than 6 hours after dilution in 2 events, and a vaccine vial was kept at temperatures up to 30°C for more than the recommended 2 hours in 1 event.

events, respectively), and improper dilution and aseptic technique were reported (3 events each).

*Vaccine administration errors (968 events, 27 of which were serious<sup>26</sup>):* Events mainly described errors in administering the second dose outside the recommended 21 days after the first dose per the RSI, errors in route of administration, errors in administration of vaccine dose not adequately prepared (see Preparation subset), errors in administration technique, errors in the volume or dosage of the vaccine administered, and errors of vaccination at the wrong anatomical site.

- *Incorrect interval between doses (502 events, 18 of which were serious<sup>27</sup>):* Errors included second dose administration more than 21 days after the first dose (426 events), second dose administration less than 21 days after the first dose [73 events; interval between the first and the second dose ranged between 1 day (1 event) to 18 days with the majority of the second doses administered between the 14<sup>th</sup> and the 17<sup>th</sup> day after the first dose (39 events)], and unspecified errors with the administration date of the second dose (3 events).
- *Errors in the route of administration (119 events, 3 of which were serious<sup>28</sup>):* The route of administration for the vaccine was subcutaneous (95 events), intravenous (9 events), intradermal/cutaneous, unspecified routes other than intramuscular (5 events each), parenteral without any further detail (3 events), intra-articular, and trans-mammary (not medically confirmed) (1 event each).
- *Administration after inadequate preparation (98 events, all non-serious):* These events referred to vaccine administered after inadequate preparation: unspecified temperature excursion (34 events), vaccine stored in the refrigerated temperatures for a longer time than specified in the RSI, temperature excursion of thawed vials (18 events each), dilution with expired diluent (12 events), dilution with sterile water for injection rather than normal saline (6 events), doses prepared as pre-filled syringes (3 events), presence

<sup>26</sup> Upon review, these 27 medication errors did not lead to harm (i.e., clinical AEs) in patients.

<sup>27</sup> Upon review, these 18 medication errors did not lead to harm in patients. Co-reported AEs unrelated to medication errors in these cases were coded to the PTs Fatigue (7), Arthralgia (4), Headache, Myalgia, Nausea, Pain in extremity (3 each), Chills, Contusion, Cough, Disease recurrence, Lymphadenopathy (2 each), Angioedema, Asthma, Asymptomatic COVID-19, Axillary pain, Bedridden, Bursitis, Cardiac failure congestive, Chest discomfort, Diarrhoea, Dizziness, Eye disorder, Eye swelling, Face oedema, Feeling abnormal, Feeling of body temperature change, Gastroesophageal reflux disease, Habit cough, Lip swelling, Lower respiratory tract infection, Malaise, Mouth ulceration, Movement disorder, Muscle fatigue, Muscle tightness, Nasal discomfort, Neck mass, Oedema, Oral herpes, Pain, Peripheral swelling, Pruritus, Psoriasis, Rash, Sudden hearing loss, Syncope, Tendonitis, Tension headache, Throat irritation, Urticaria, Vaccination site mass, Vaccination site pain, and White blood cell count decreased (1 each).

<sup>28</sup> Upon review, these 3 medication errors did not lead to harm in patients. Co-reported AEs unrelated to medication errors in these cases were coded to the PTs Blood pressure increased, Cardiac disorder, Heart valve incompetence, Hypertension, Malaise, Shoulder injury related to vaccine administration, and Troponin increased.

of particulates [white particulate and piece of latex (1 event each)], vaccine discolouration [brownish-orange and brown (1 event each)], unspecified administration of inadequately prepared vaccine (2 events each), and vaccine dose from a cracked vial (1 event).

- *Errors in administration technique (48 events, 1 of which was serious<sup>29</sup>):* These errors involved the use of an incorrect needle or syringe (38 events), improper aseptic technique during administration, unspecified administration technique errors (4 events each), vaccine administered too quickly per vaccinee, and additional dose administered due to leakage of the initial injection (1 event each).
- *Errors in vaccine dosage (41 events, 1 of which was serious<sup>30</sup>):* These errors involved administration of vaccine doses with a lower concentration (17 events), 2 vaccine doses administered on the same day (11 events), unspecified improper dilution, unspecified errors in vaccine dosage (3 events each), administration of vaccine doses with a higher concentration (5 events), administration of an entire vial as 1 injection, and administration of a third dose (1 event each).
- *Errors in the volume administered (37 events, all non-serious):* Errors included administration of partial doses due to leakage (16 events), larger volumes of the correct dosage of vaccine (8 events), partial doses due to syringe or needle malfunction (7 events), smaller volumes of the correct dosage of vaccine (6 events).
- *Vaccination site other than deltoid muscle (32 events, 2 of which were serious<sup>31</sup>):* The vaccine was administered in the vaccinee's arm but not in the deltoid muscle (10 events), an unspecified location other than the deltoid muscle (7 events), leg, shoulder, tricep (4 events each), forearm, gluteus muscle, and hand (1 event each).
- *Wrong vaccine other than recommended in the RSI administered (16 events, 1 of which was serious<sup>32</sup>):* Vaccinees received 1 dose of the AstraZeneca vaccine and 1 dose of the BioNTech-Pfizer vaccine, 1 dose of the Moderna vaccine and 1 dose of the BioNTech-Pfizer vaccine (6 events each), 1 dose of the Sinovac vaccine and 1 dose of the BioNTech-Pfizer vaccine, and 1 dose of an unknown vaccine and 1 dose of the BioNTech-Pfizer vaccine (2 events each).

<sup>29</sup> Upon review, this medication error did not lead to harm in the patient. A co-reported AE unrelated to the medication error in this case was coded to the PT Pain in extremity.

<sup>30</sup> Upon review, this medication error did not lead to harm in the patient. Co-reported AEs unrelated to the medication error in this case were coded to the PTs Dizziness, Headache, Illness, and Pain.

<sup>31</sup> Upon review, these 2 medication errors did not lead to harm in patients. Co-reported AEs unrelated to medication errors in these cases were coded to the PTs Vaccination site pain (2), Arthralgia, Cerebrovascular accident, Balance disorder, Gait disturbance, Limb discomfort, Hypoaesthesia, Hypokinesia, Multiple sclerosis, Muscular weakness, Myocardial infarction, and Thrombosis (1 each).

<sup>32</sup> Upon review, this medication error did not lead to harm in the patient. A co-reported AE unrelated to the medication error in this case was coded to the PT Atonic seizures.

- *Use in unauthorized individuals (11 events, all non-serious):* The vaccine was inadvertently administered to paediatric individuals below 16 years of age (see [Section 9.5.4 Use in Paediatric Individuals <16 Years of Age](#)) (10 events), and an individual with active infection (sinus) (1 event each).
- *Accidental exposure to vaccine (12 events, all non-serious):* These errors involved exposure to the skin (10 events) and eye (2 events).
- *Dose of vaccine not administered (4 events, all non-serious):* Errors included administration of only normal saline solution (2 events), injection with an empty syringe, and injection of the needle without dose administration (1 event each).
- *Other vaccine administration errors (48 events, 1 of which was serious<sup>33</sup>):* Errors mainly included administration of expired vaccine<sup>34</sup> (23 events), the use of concomitant drugs<sup>35</sup> (7 events), underdose (i.e., from poor administration technique, over-diluted vaccine, syringe/needle malfunction, incorrect route of administration, and leakage) (5 events), administration of a poor quality vaccine (i.e., recalled lot and “manufacturing defect”) (2 events).

*Vaccine scheduling errors (131 events, all non-serious):* Events mainly described errors involving scheduled second dose vaccinations outside the recommended 21 days after the first dose.

- *Incorrect interval between doses (38 events, all non-serious):* The second dose was scheduled more than 21 days after the first dose (26 events) and the second dose of the vaccine was scheduled less than 21 days after the first dose (12 events).
- *Other scheduling errors (93 events, all non-serious):* The vaccinee cancelled or missed their appointment (48 events), no scheduled appointment for the second dose (32 events), the second dose was not available due to a supply issue (9 events), appointment cancelled by the vaccination site (2 events), the vaccination date conflicted with another

<sup>33</sup> Upon review, this medication error did not lead to harm in the patient. Co-reported AEs unrelated to the medication error in this case were coded to the PTs Allergic reaction to excipient, Erythema, and Rash pruritic.

<sup>34</sup> Vaccine was administered more than 6 hours after dilution in 6 events, a vial was left in the refrigerator for more than 5 days in 1 event, a consumer reported that the administered vaccine was expired based on information on her vaccination card in 1 event, and expiry details were not provided in the remaining 15 events.

<sup>35</sup> No co-suspect drugs were reported.

appointment/procedure, and the second dose was not administered for an unknown reason (1 event each).

*Other medication errors (12 events, all non-serious):* Events mainly described vaccination appointment unavailability (3 events), patient resistance for a second dose, error on the vaccination card (2 events each).

***Potential medication errors (46 medication errors in 46 cases)***

There were 2 cases from the EU/EEA area (France and Italy) and 44 cases from non-EU/EEA countries [US (38), Mexico (4), Australia, and Colombia (1 each)].

- *Potential dosing interval errors (8 events, all non-serious):* Events mainly described potential errors posed from patients not notified their second dose vaccination appointment is by the vaccination site (3 events), scheduling of the second dose vaccination outside of the 21-day interval, and patients potentially missing their scheduled vaccination appointment (2 events each).
- *Other potential errors (38 events, all non-serious):* Events mainly described patient questions around potential drug-drug interactions, scheduling, vaccine dosing, counterfeit vaccines, concurrent treatment/procedures, and potential AEs.

Some medication errors are expected to occur despite written instructions and educational activities for HCPs administering the vaccine. The number and seriousness of the reported medication errors do not indicate a need for additional mitigation activity.

**8. GENERAL OVERVIEW**

A total of 30,752 case reports (15,233 medically confirmed and 15,519 non-medically confirmed) containing 112,836 events fulfilled criteria for inclusion in this SMSR. Refer to [Appendix 2](#) for the summary tabulations of all cases received during the current reporting period.

- a. Including 12 cases for which a paediatric age was initially reported but that they re-evaluated as not consistent with this age upon review (see [Table 14](#), *Use in Paediatric Individuals <16 Years of Age*) and 31 breastfed babies for which paediatric age was reported;
- b. Including 31 breastfed babies for which age was not reported;
- c. Cases retrieved applying the criteria in place to identify the reports involving the special populations of Immunocompromised patients, Patients with autoimmune or inflammatory disorders, Frail patients with comorbidities (e.g. COPD, diabetes, chronic neurological disease, cardiovascular disorders, active tuberculosis) described as Missing Information in [Table 14](#).

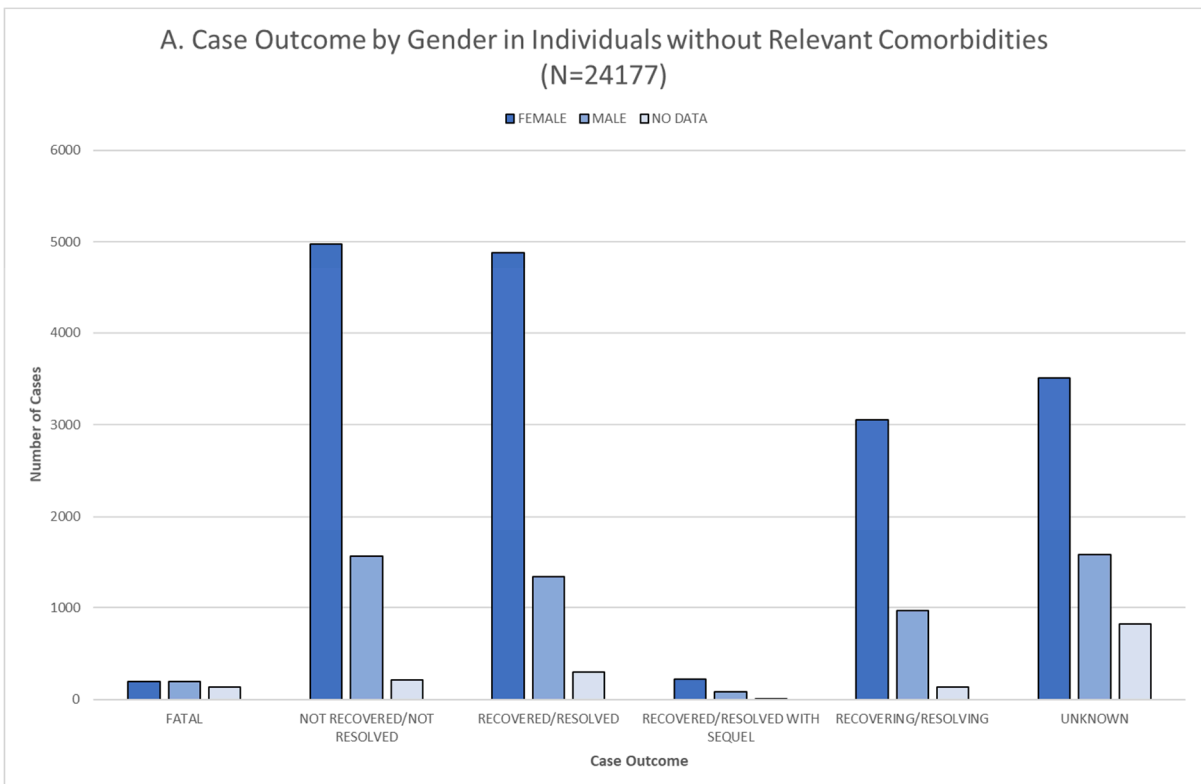

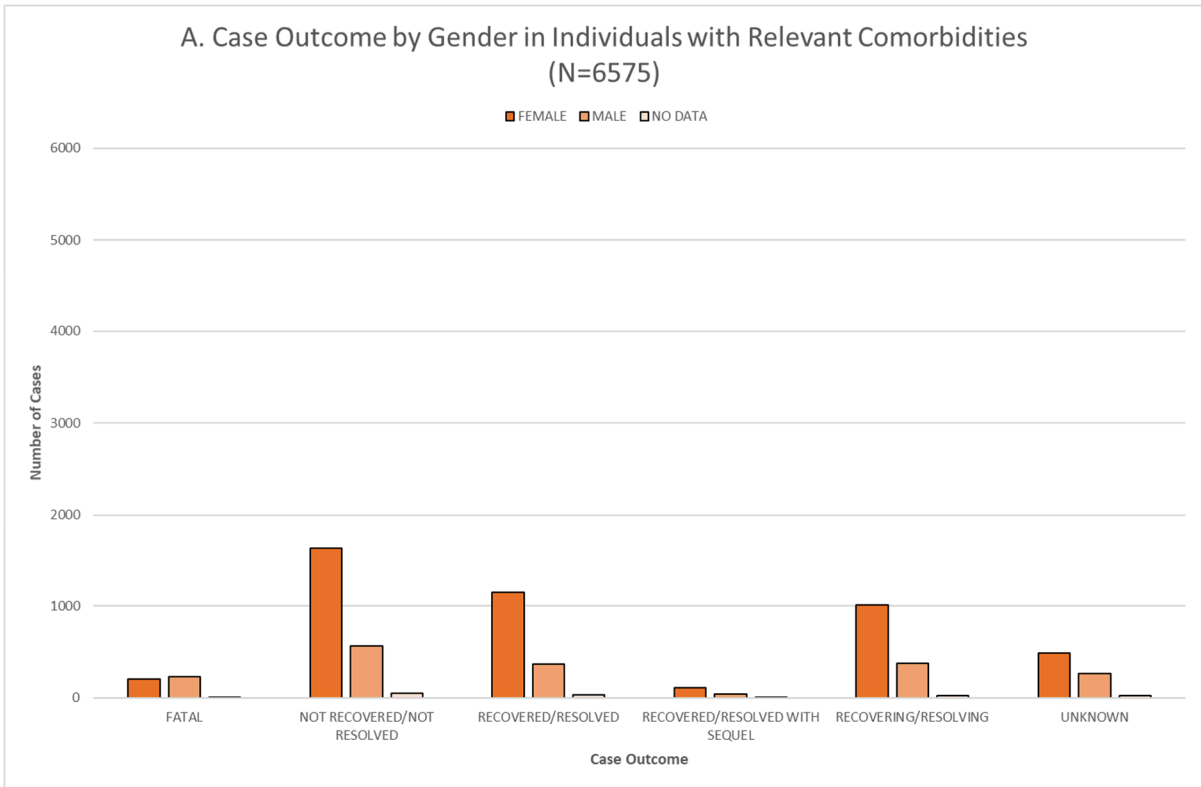

Case outcome by age group, gender and presence of relevant comorbidities is presented in [Figure 1](#), [Figure 2](#) and [Figure 3](#). Across all age groups, there were more females than males reporting adverse events. Overall, the proportion of cases with fatal outcome is higher when relevant comorbidities are reported ([Figure 1](#)). Among the cases with a fatal outcome, there is a similar pattern for gender both in presence or in absence of relevant comorbidities ([Figure 2-A](#)). Keeping in consideration the age group ([Figure 2-B](#)), when the age was known, there are no differences in the proportion of cases with a fatal outcome, with the highest number of cases in individuals aged 75 years and older, either in presence or absence of relevant comorbidities. (please also see *Death* in [Table 13](#) and *Frail patients with co-morbidities e.g. COPD, diabetes, chronic neurological disease, cardiovascular disorders, active tuberculosis*, described as Missing Information in [Table 14](#)).

**ADVERSE EVENT DATA**

As shown in Figure 4, the MedDRA SOC containing the greatest number of events ( $\geq 2\%$ ) were General disorders and administration site conditions (32,762), Nervous system disorders (18,369), Musculoskeletal and connective tissue disorders (11,981), Gastrointestinal disorders (9,020), Skin and subcutaneous tissue disorders (6373), Respiratory, thoracic and mediastinal disorders (6345), Infections and infestations (4297), Injury, poisoning and procedural complications (3926), Vascular disorders (2864), Investigations (2750), Cardiac disorders (2479) and Blood and lymphatic system disorders (2311). Of note, multiple adverse events may be reported in a single case.

**Figure 4. General Overview: Total Number of Events by MedDRA SOC and Event Seriousness**

The overall safety evaluation includes a review of the most frequently reported events by SOC and by the PT for events reported in ( $\geq 2\%$ ) of all cases during the reporting interval as compared to the cumulative period since the first temporary authorisation for emergency supply on 01 December 2020.

c. Consistent with anaphylactic reactions listed in the current RSI;

\* Reporting proportion (% of total cases) in the current reporting period.

Most of the frequently reported events are listed or consistent with listed events as per the current RSI. Of note, the frequently reported events Dizziness and Paraesthesia, not listed as per the current RSI, are being added to the RSI.

During the reporting interval, the distribution of the AEs reported in more than 2% of the cases by gender is presented in [Figure 5](#). The observed imbalance in the female gender distribution reflects the imbalance in the gender distribution of the cases received in the reporting period.

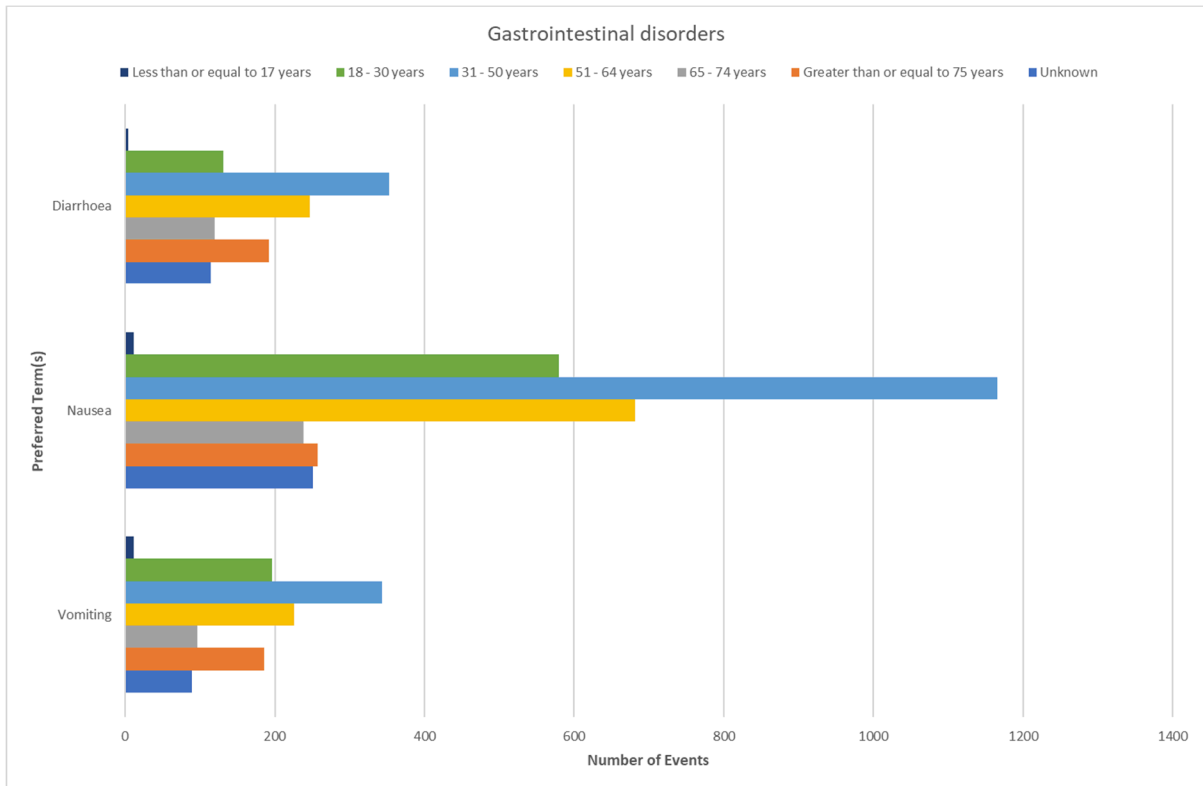

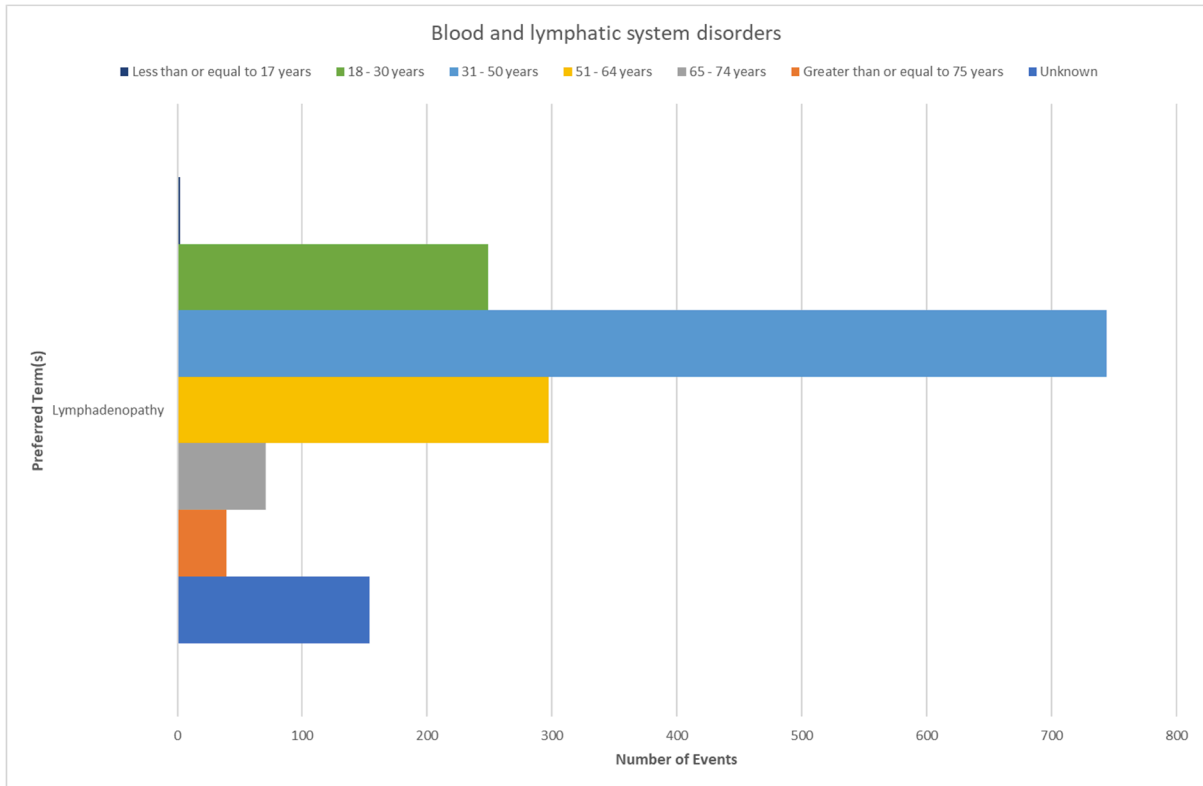

The distribution of the AEs reported in more than 2% of the cases by age group and by SOC is shown in [Figure 6](#) and [Figure 7](#). Across the SOCs, the largest number of events is reported overall in the 31-50 years age group, followed by the 51-64 years age group with the exception of COVID-19. When the age was reported, the largest number of COVID-19 occurrences is reported in the 75 years and older group followed by the 31-50 years age group, and by the 51-64 years age group, respectively.

## 9. SIGNAL AND RISK EVALUATION

### 9.1. Literature Review

Please refer to [Appendix 6](#) for a summary description of the interval literature review that is performed for the purpose of signal detection.

There was 1 literature article, a case report, that described the occurrence of minimal change disease (MCD) with nephrotic syndrome (NS) and acute kidney injury (AKI) in a patient who had received the first dose of BNT162b2. As per the article: “A 50-year-old previously healthy male was admitted to the hospital following the appearance of peripheral edema. Ten days earlier, he had received the first injection of the vaccine. Four days after injection, he developed lower leg edema, which rapidly progressed to anasarca. On admission, serum creatinine was 2.31 mg/dL and 24-hr urinary protein excretion was 6.9 grams. As kidney function continued to decline over the next days, empiric treatment was initiated with prednisone 80 mg/day. A kidney biopsy was performed and the findings were consistent with MCD. Ten days later, kidney function began to improve, gradually returning to normal. The clinical trial of MCD, NS and AKI has been previously described under a variety of circumstances, but not following the Pfizer COVID-19 vaccine. The association between the vaccination and MCD is at this time temporal and by exclusion, and by no means firmly established. We await further reports of similar cases to evaluate the true incidence of this possible vaccine side-effect.” The safety topic of nephrotic syndrome was evaluated by the MAH and determined not to be validated signal (see [Appendix 3](#) and [Appendix 3.1](#)).

In addition, as per the *EMA PRAC assessment report (Product No. EMEA/H/C/005735/MEA/002.3) received on the fourth SMSR*, the MAH reviewed the article by Krammer et al., entitled “Robust spike antibody responses and increased reactogenicity in seropositive individuals after a single dose of SARS-CoV-2 mRNA vaccine”. The MAH maintains that the most informative data comparing reactogenicity of vaccine doses 1 and 2 in individuals who have previous exposure to SARS-CoV-2 is from the clinical study C4591001. The most recent safety data cut-off for the clinical study data is 13 Mar 2021 and a clinical study report is in progress. The MAH did an analysis for individuals positive at baseline compared to those negative at baseline. It was shown that that the first dose gave higher reactogenicity rates in individuals positive at baseline than observed in those negative at baseline. This is consistent with the publication. However, with administration of the second dose, those positive at baseline had much lower rates of reactogenicity compared to those negative at baseline. If you look at any reactogenicity for Dose 1 and Dose 2, the rates were basically the same (although numerically lower in those positive at baseline). Hence the conclusion that, for a 2-dose series, baseline serostatus does not impact the overall safety profile of a population of people where serostatus is not known. In the recent analysis for the BLA the MAH found the same thing. The flaw in the analysis in the paper is that they only gave 1 dose and assumed that the second dose would be worse, when in reality, it was not. Additionally, the MAH could also say that while 1 dose of vaccine gives increased antibody responses we do not know whether those responses are sufficient given all the variants of concern circulating. The in vitro data shows potent neutralization responses after two doses – not one. The laboratory data and the measured efficacy from the MAH trial supports 2 doses of vaccine especially in the setting of emerging variants. Only a randomized controlled

clinical trial can address whether a vaccine could be as successful with 1 dose as opposed to measured neutralization responses and efficacy of 2 doses.

## 9.2. Overview of Safety Topics and Signals During the Reporting Interval

Safety topics and Signals addressed during the reporting interval are presented below in Table 9.

**Table 9. Overview of Safety Topics and Signals**

Cranial nerve palsy	Safety Topic Closed	No Validated Signal
Hemolytic anemia	Safety Topic Closed	No Validated Signal
Hepatic events	Safety Topic Closed	No Validated Signal
Nephrotic syndrome	Safety Topic Closed	No Validated Signal
Optic neuritis	Safety Topic Closed	No Validated Signal
Trigeminal neuralgia	Safety Topic Closed	No Validated Signal

[Appendix 3](#) provides a summary of the safety topics and signals addressed during the reporting interval and [Appendix 3.1](#) an evaluation of these safety topics and signals.

*As per EMA PRAC assessment report (Product No. EMEA/H/C/005735/MEA/002.3) received on the fourth SMSR, the following cumulative overviews were performed for:*

Polyneuropathy and Neuropathy peripheral ([Appendix 3.2](#));

Herpes Zoster ([Appendix 3.3](#)).

*As per request received from Saudi Arabia HA, the following cumulative overview was performed for:*

Seizure ([Appendix 3.4](#)).

*As per request received from Singapore HA, the following cumulative overview was performed for:*

Optic neuritis ([Appendix 3.5](#)) and Cranial nerve palsy ([Appendix 3.6](#)).

*As per request received from different HAs, the following cumulative overview was performed for:*

Myocarditis and Pericarditis ([Appendix 3.7](#)).

### 9.3. Summary of Safety Concerns

Table 10 summarises the comprehensive list of important risks and missing information reflected in risk management and pharmacovigilance plans globally for BNT162b2 at the beginning of the reporting period. The pharmacovigilance and risk management activities implemented for the safety concerns by Pfizer on behalf of BioNTech are global.

c. As per the US PVP Version 0.3, dated 20 January 2021; this Missing Information has been reworded to “Use in paediatric individuals <12 years of age” in the US PVP, Version 0.4, submitted on 09 April 2021;

d. As per the South Africa RMP, Version 1.0, dated 24 March 2021, active tuberculosis is included as an additional co-morbidity;

e. As per the South Africa RMP, Version 1.0, dated 24 March 2021, this safety concern is stated as “Vaccine effectiveness against novel variant(s) in South Africa”. For vaccine effectiveness against novel variant(s) in South Africa, in the Lack of Efficacy Section (Section 9.5.3) it will be reviewed whether any reports and/or virological analysis of variant type on any breakthrough infection is reported among the relevant cases.

### 9.4. Summary of Adverse Events of Special Interest (AESIs)

Please refer to [Appendix 5](#) for the list of the company’s AESIs for BNT162b2. Please refer to [Appendix 5.1](#) for the observed versus expected analysis for AESIs.

The company’s AESI list takes into consideration the lists of AESIs from the following expert groups and regulatory authorities: Brighton Collaboration (SPEAC), ACCESS

protocol, US CDC (preliminary list of AESI for VAERS surveillance), MHRA (unpublished guideline).

The AESI terms are incorporated into a TME list and include events of interest due to their association with severe COVID-19 and events of interest for vaccines in general.

The AESI list includes MedDRA PTs, HLTs, HLGTS or MedDRA SMQs and can be changed as appropriate based on the evolving safety profile of the vaccine.

## 9.5. Evaluation of Safety Concerns

Evaluation of new information collected from post-marketing data sources<sup>13</sup> for BNT162b2 during the interval reporting period for important identified and important potential risks, AESIs, special situations and missing information is provided below in Section 9.5.1, Section 9.5.2, Section 9.5.3 and Section 9.5.4.

### 9.5.1. Evaluation of Important Identified and Important Potential Risks

Table 11 below presents the evaluation of new information received during the interval reporting period from post-marketing data sources<sup>13</sup> for the important identified and important potential risks of BNT162b2.

Safety Risk	Post-Marketing <sup>a</sup> Cases Evaluation Total Number of Cases in the Reporting Period (N=30752)
	<p><i>Anaphylaxis is an identified risk for the BNT162 vaccine and is described in the product labeling. The MAH proposes to update the search criteria in subsequent reports to more specifically focus on anaphylaxis to ensure that the analysis provides useful information about this topic and recommendations pertaining to it (e.g. observation time post vaccination). Thus, the search will be based on the following PTs: Anaphylactic reaction, Anaphylactic shock, Anaphylactoid reaction, Anaphylactoid shock and same criteria will be applied also to calculate the O/E analysis. Identified cases with a fatal outcome will be scrutinized to understand the clinical details and evolution of the event/s. Note that all retrieved cases will be considered in the analysis of this safety topic (the Brighton Collaboration criteria gauging the reliability of the diagnosis will only be applied to a case if warranted for individual discussion of that case).</i></p>
<p><b>Important Potential Risk</b>                      Vaccine-Associated Enhanced Disease (VAED) Including Vaccine-Associated Enhanced Respiratory Disease (VAERD)<sup>b,c</sup></p>	<p>VAED is a modified and/or severe presentation of an infectious disease affecting individuals exposed to the wild-type pathogen after having received vaccine designed to prevent infection.<sup>37</sup></p> <p>As noted by the Brighton Collaboration, there is currently no uniformly accepted definition of VAED (or VAERD) and the BC working group considers that a definitive case of VAED (Level 1 diagnostic certainty) cannot be ascertained with current knowledge of the mechanisms of pathogenesis of the condition; they have provided guidance on levels of diagnostic certainty of VAED cases based on various laboratory and clinical findings.</p> <p>No post-authorized AE reports have been identified as cases of VAED/VAERD, therefore, there is no observed data at this time. An expected rate of VAED is difficult to establish so a meaningful observed/expected analysis cannot be conducted at this point based on available data. The feasibility of conducting such an analysis will be re-evaluated on an ongoing basis as data on the virus grows and the vaccine safety data continues to accrue.</p> <p>The search criteria utilised to identify potential cases of VAED for this SMSR includes PTs indicating a lack of effect of the vaccine and medical disorders chosen because they are PTs potentially indicative of severe or atypical COVID-19.</p> <p><b>Overview</b></p> <ul style="list-style-type: none"> <li>Number of cases based on search strategy: 114<sup>f</sup> (0.4% of the total PM dataset, compared to 0.3% in the previous reporting period), all serious (of which 81 are medically confirmed).</li> </ul>

During the open-label follow-up period for participants originally randomized to BNT162b2, a 51-year-old male developed Bell’s palsy 154 days after receiving Dose 2.</p> <p>Post-authorisation cumulative reports of Facial paralysis and Facial paresis to 23 April 2021 (N=1447), were reviewed. Of the 1447 cases, 571 are not medically confirmed; 923 reports are in women, 461 in men and 63 do not report sex. Not including 2 reports (Health authority reports for a 1 year old and 2 year old that are suspected to be inaccurately reporting age), ages range from 16 to 100 years (mean 54.9, median 53) with the bulk of cases (33%) being between the ages of 31 and 50. Many of the 1447 cases are reported to be Bell’s palsy</p>

	<p>without provision of information (e.g. neurological exam, HCP assessment) to confirm the diagnosis. Many describe only sensory symptoms and not motor function loss. Further, many (&gt;1 report in 20) reports describe the occurrence of potential TIAs or strokes. Other commonly co-reported conditions include potential viral infections (&gt; 1 in 100, with the majority being herpetic), migraine (&lt;1 in 100) and sensory symptoms suggestive of stress reactions. Of the cases without other events reported, 1 in 10 occur the same day as vaccination, the timing of which make an immunologic cause unlikely.</p> <p>In regard to other signal detection activities, the post-authorization spontaneous data observed vs expected analyses have been &lt; 1, and the actual O/E may be lower because all cases of facial paralysis and facial paresis reported are included regardless of the strength of the certainty of diagnosis. In addition, routine disproportionality analysis has not been elevated.</p> <p>Considering the totality of data on this topic, including the epidemiology of facial paralysis, the data is not conclusive of a causal association between the event and Pfizer/BNT COVID-19 Vaccine. The MAH is hopeful that large epidemiologic surveillance studies that are ongoing will contribute to the assessment of facial paralysis in a meaningful way. Of note, cases of Bell’s palsy are being collected in epidemiology studies that are both primary data collection studies (e.g. C4591008, C4591010) and secondary data collection studies (e.g. C4591009, C4591012, C4591021).</p>

Surveillance will continue. The topic of thromboembolism, specifically in association with thrombocytopenia, has emerged as a concern for some COVID-19 vaccines and is being carefully monitored for the Pfizer/BTN COVID-19 vaccine. This current SMSR includes a review of cases that are of potential interest (see <a href="#">Appendix 3.8</a>) and the MAH will continue to present these cases in the SMSR for the time being. The increase in reported thromboembolic events compared to last SMSR may be due to stimulated reporting of events in light of recent</p>

## 10. OVERALL BENEFIT-RISK EVALUATION

### 10.1. Benefits

BNT162b2 is indicated for active immunisation to prevent COVID-19 caused by SARS-CoV-2 virus, in individuals 12 years of age and older.

#### Efficacy in participants 16 years of age and older

In the Phase 2/3 portion, approximately 44,000 participants were randomised equally and were to receive 2 doses of COVID-19 mRNA Vaccine or placebo (normal saline) separated by 21 days. The efficacy analyses included participants that received their second vaccination within 19 to 42 days after their first vaccination. Participants are planned to be followed for up to 24 months after Dose 2, for assessments of safety and efficacy against COVID-19.

The population for the analysis of the primary efficacy endpoint included 36,621 participants 12 years of age and older (18,242 in the COVID-19 mRNA Vaccine group and 18,379 in the placebo group) who did not have evidence of prior infection with SARS-CoV-2 through 7 days after the second dose. In addition, 134 participants were between the ages of 16 to 17 years of age (66 in the COVID-19 mRNA Vaccine group and 68 in the placebo group) and 1616 participants 75 years of age and older (804 in the COVID-19 mRNA Vaccine group and 812 in the placebo group).

At the time of the primary efficacy analysis, participants had been followed for symptomatic COVID-19 for in total 2,214 person-years for the COVID-19 mRNA Vaccine and in total 2,222 person-years in the placebo group. There were no meaningful clinical differences in overall vaccine efficacy in participants who were at risk of severe COVID-19 including those with 1 or more comorbidities that increase the risk of severe COVID-19 (e.g. asthma, body mass index (BMI)  $\geq$  30 kg/m<sup>2</sup>, chronic pulmonary disease, diabetes mellitus, hypertension).

The vaccine efficacy information is presented in Table 15.

Note: Confirmed cases were determined by Reverse Transcription-Polymerase Chain Reaction (RT-PCR) and at least 1 symptom consistent with COVID-19 [\*Case definition: (at least 1 of) fever, new or increased cough, new or increased shortness of breath, chills, new or increased muscle pain, new loss of taste or smell, sore throat, diarrhoea or vomiting.]

\* Participants who had no serological or virological evidence (prior to 7 days after receipt of the last dose) of past SARS-CoV-2 infection (i.e., N-binding antibody [serum] negative at Visit 1 and SARS-CoV-2 not detected by nucleic acid amplification tests (NAAT) [nasal swab] at Visits 1 and 2), and had negative NAAT (nasal swab) at any unscheduled visit prior to 7 days after Dose 2 were included in the analysis.

- a. N = number of participants in the specified group.
- b. n1 = Number of participants meeting the endpoint definition.
- c. Total surveillance time in 1000 person-years for the given endpoint across all subjects within each group at risk for the endpoint. Time period for COVID-19 case accrual is from 7 days after Dose 2 to the end of the surveillance period.
- d. n2 = Number of subjects at risk for the endpoint.
- e. No confirmed cases were identified in participants 12 to 15 years of age.
- f. Confidence interval (CI) for vaccine efficacy is derived based on the Clopper and Pearson method adjusted to the surveillance time. CI not adjusted for multiplicity.

In the second primary analysis, compared to placebo, efficacy of COVID-19 mRNA Vaccine in participants from first COVID-19 occurrence from 7 days after Dose 2 compared to participants with or without evidence of prior infection with SARS-CoV-2 was 94.6% (95% credible interval of 89.9% to 97.3%) in participants 16 years of age and older.

Additionally, subgroup analyses of the primary efficacy endpoint showed similar efficacy point estimates across genders, racial and ethnic groups, and participants with medical comorbidities associated with high risk of severe COVID-19.

Secondary efficacy analyses suggested benefit of the COVID-19 mRNA Vaccine in preventing severe COVID-19. Efficacy against severe COVID-19 (as defined by the study protocol\*) occurring after the first dose was 88.9% (95% CI: 20.1, 99.7) (1 case in COVID-19 mRNA Vaccine group and 9 cases in placebo group), with an estimated vaccine efficacy of 75.0% (95% CI: -152.6, 99.5) (1 case in COVID-19 mRNA Vaccine group and 4 cases in placebo group) against severe COVID-19 occurring at least 7 days after Dose 2.

## Efficacy and immunogenicity in adolescents 12 to 15 years of age

Study 2 is a multicenter, placebo-controlled efficacy study in participants 12 years of age and older. Randomization was stratified by age: 12 through 15 years of age, 16 through 55 years of age, or 56 years of age and older, with a minimum of 40% of participants in the  $\geq 56$ -year stratum. The study excluded participants who were immunocompromised and those who had previous clinical or microbiological diagnosis of COVID-19. Participants with pre-existing stable disease, defined as disease not requiring significant change in therapy or hospitalization for worsening disease during the 6 weeks before enrollment, were included as were participants with known stable infection with HIV, HCV, or HBV).

In Study 2 an analysis of SARS-CoV-2 neutralizing titers in a randomly selected subset of participants was performed to demonstrate non-inferior immune responses (within 1.5-fold) comparing adolescents 12 to 15 years of age to participants 16 to 25 years of age who had no serological or virological evidence of past SARS-CoV-2 infection. The immune response to BNT162b2 in adolescents 12 to 15 years of age (n=190) was non-inferior to the immune response in participants 16 to 25 years of age (n=170), based on results for SARS-CoV-2 neutralizing titers at 1 month after Dose 2. The GMT ratio of the adolescents 12 to 15 years of age group to the participants 16 to 25 years of age group was 1.76, with a 2-sided 95% CI of 1.47 to 2.10, meeting the 1.5-fold non-inferiority criterion (the lower bound of the 2-sided 95% CI for the GMR  $>0.67$ ) which indicates a statistically greater response in the adolescents 12 to 15 years of age than that of participants 16 to 25 years of age.

### **10.2. Risks**

Based on pharmacovigilance monitoring activities, since first authorisation, anaphylaxis has been recognised as an important identified risk. Hypersensitivity reactions (other than Anaphylaxis), Diarrhoea, Pain in extremity (arm) and Vomiting were also assessed as identified risks (not important for the purpose of inclusion in the RMPs and PVP) and added as adverse reactions to the labeling. Vaccine stress-related responses (including Dizziness, Paraesthesia and Tachycardia among other) and Asthenia, Lethargy, Decreased appetite, Hyperhidrosis, Night sweats were evaluated to be identified risks (not important for the purpose of inclusion in the in the RMPs and PVP) and they will be added to the RSI.

Based on all available safety and efficacy data for BNT162b2 the benefit-risk profile of the vaccine remains favourable.

### **10.3. Overall Benefit-Risk**

The identified risks associated with the use of BNT162b2 are mitigated through provision of relevant product information in the RSI to support safe use of the product. Risks have been evaluated in the context of the enumerated benefits of the product. Based on the available safety and efficacy data for BNT162b2, the overall benefit-risk profile of BNT162b2 remains favourable.

## **11. CONCLUSION AND ACTIONS**

Based on all available safety and efficacy data for BNT162b2 the benefit-risk profile of the vaccine remains favourable.

The MAH will continue to review the safety of BNT162b2, including reports of adverse experiences and will revise the product documents if an evaluation of the safety data yields significant new information.

## 1. NAME OF THE MEDICINAL PRODUCT

COVID-19 mRNA Vaccine (nucleoside modified) and COMIRNATY are called TRADENAME.

## 2. QUALITATIVE AND QUANTITATIVE COMPOSITION<sup>1,2</sup>

This is a multidose vial and must be diluted before use.

One vial (0.45 mL) contains 6 doses of 0.3 mL after dilution, see Section 6.6.

One dose (0.3 mL) contains 30 micrograms of COVID-19 mRNA Vaccine (embedded in lipid nanoparticles).

TRADENAME is highly purified single-stranded, 5'-capped messenger RNA (mRNA) produced using a cell-free *in vitro* transcription from the corresponding DNA templates, encoding the viral spike (S) protein of severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2).

For the full list of excipients, see Section 6.1.

## 3. PHARMACEUTICAL FORM<sup>2,3</sup>

Concentrate for solution for injection.

The vaccine is a white to off-white frozen solution.

## 4. CLINICAL PARTICULARS

### 4.1. Therapeutic indications

The following is a representative indication. Locally approved indications may differ.

Active immunization to prevent coronavirus disease 2019 (COVID-19) caused by SARS-CoV-2 virus, in individuals 12 years of age and older.<sup>4,49</sup>

### 4.2. Posology and method of administration

#### Posology

##### *Individuals 12 years of age and older*

TRADENAME is administered intramuscularly after dilution as a series of 2 doses (0.3 mL each) at greater than or equal to 21 days (preferably 3 weeks) apart.<sup>5,49</sup>

There are no data available on the interchangeability of TRADENAME with other COVID-19 vaccines to complete the vaccination series. Individuals who have received 1 dose of

TRADENAME should receive a second dose of TRADENAME to complete the vaccination series.

Individuals may not be protected until at least 7 days after their second dose of the vaccine.<sup>6</sup>

For further information on efficacy, see Section 5.1.

#### *Pediatric population*

The safety and efficacy of TRADENAME in individuals under 12 years of age have not yet been established.

#### *Geriatric population*

Clinical studies of TRADENAME include participants 65 years of age and older and their data contributes to the overall assessment of safety and efficacy.<sup>7</sup> Of the total number of TRADENAME recipients in Study 2 (N=20,033), 17.1% (n=3434) were 65 through 74 years of age and 4.3% (n=860) were 75 years of age and older (see Section 5.1).<sup>8</sup>

#### Method of administration

Administer TRADENAME intramuscularly in the deltoid muscle after dilution.

Do not inject the vaccine intravascularly, subcutaneously, or intradermally.

After dilution, vials of TRADENAME contain 6 doses of 0.3 mL of vaccine. Low dead-volume syringes and/or needles can be used to extract 6 doses from a single vial. If standard syringes and needles are used, there may not be sufficient volume to extract a sixth dose from a single vial.

Irrespective of the type of syringe and needle:

- Each dose must contain 0.3 mL of vaccine.
- If the amount of vaccine remaining in the vial cannot provide a full dose of 0.3 mL, discard the vial and any excess volume.
- Do not pool excess vaccine from multiple vials.

For instructions on the handling, dilution, and dose preparation of the vaccine before administration, see Section 6.6.

### **4.3. Contraindications**

Hypersensitivity to the active substance or to any of the excipients listed in Section 6.1.

### **4.4. Special warnings and precautions for use**

#### Traceability

In order to improve the traceability of biological medicinal products, the name and the batch number of the administered product should be clearly recorded.

### General recommendations

As with all injectable vaccines, appropriate medical treatment and supervision must always be readily available in case of a rare anaphylactic event following the administration of the vaccine.<sup>9</sup>

The administration of TRADENAME should be postponed in individuals suffering from acute severe febrile illness.<sup>9</sup>

Individuals receiving anticoagulant therapy or those with a bleeding disorder that would contraindicate intramuscular injection, should not be given the vaccine unless the potential benefit clearly outweighs the risk of administration.<sup>9</sup>

Immunocompromised persons, including individuals receiving immunosuppressant therapy, may have a diminished immune response to the vaccine.

As with any vaccine, vaccination with TRADENAME may not protect all vaccine recipients.

#### **4.5. Interaction with other medicinal products and other forms of interaction**

No interaction studies have been performed.

Do not mix TRADENAME with other vaccines/products in the same syringe.

#### **4.6. Fertility, pregnancy and lactation**

##### Pregnancy

There are limited amount of data from the use of TRADENAME in pregnant women. Animal studies do not indicate direct or indirect harmful effects with respect to pregnancy, embryo/fetal development, parturition, or post-natal development (see Section 5.3).<sup>10,11</sup> Administration of TRADENAME in pregnancy should be considered when the potential benefits outweigh any potential risks for the mother and fetus.

##### Lactation

It is unknown whether TRADENAME is excreted in human milk.

##### Fertility

It is unknown whether TRADENAME has an impact on fertility. Animal studies do not indicate direct or indirect harmful effects with respect to female fertility or reproductive toxicity (see Section 5.3).<sup>10,11</sup>

#### 4.7. Effects on ability to drive and use machines

TRADENAME has no or negligible influence on the ability to drive and use machines. However, some of the effects mentioned under Section 4.8 “Undesirable effects” may temporarily affect the ability to drive or use machines.

#### 4.8. Undesirable effects

##### Summary of safety profile

The safety of TRADENAME was evaluated in participants 12 years of age and older in 2 clinical studies conducted in the United States, Europe, Turkey, South Africa, and South America.<sup>12,49</sup> Study BNT162-01 (Study 1) enrolled 60 participants, 18 through 55 years of age. Study C4591001 (Study 2) enrolled approximately 46,000 participants,<sup>41</sup> 12 years of age or older.<sup>12</sup>

##### *Participants 16 years of age and older*

In Study 2, a total of 21,720 participants 16 years of age or older received at least 1 dose of TRADENAME and a total of 21,728 participants 16 years of age or older received placebo.<sup>13</sup>

The most frequent adverse reactions in participants 16 years of age and older (in order from highest to lowest frequencies) were injection site pain (>80%),<sup>14</sup> fatigue (>60%),<sup>13</sup> headache (>50%),<sup>13</sup> myalgia and chills (>30%),<sup>13</sup> arthralgia (>20%),<sup>13</sup> pyrexia<sup>13</sup> and injection site swelling<sup>14</sup> (>10%) and were usually mild or moderate in intensity and resolved within a few days after vaccination. A lower frequency of reactogenicity events was associated with greater age.<sup>15</sup>

The safety profile in 545 participants receiving TRADENAME, that were seropositive for SARS-CoV-2 at baseline, was similar to that seen in the general population.<sup>17,28,31</sup>

##### *Adolescents 12 through 15 years of age*

In an analysis of Study 2, based on data up to the cutoff date of 13 March 2021, 2260 adolescents (1131 TRADENAME; 1129 placebo) were 12 to 15 years of age. Of these, 1308 adolescents (660 TRADENAME and 648 placebo) have been followed for at least 2 months after the second dose of TRADENAME.<sup>41,42</sup> The safety evaluation in Study 2 is ongoing.

The most frequent adverse reactions in adolescents 12 through 15 years of age were injection site pain (>90%), fatigue and headache (>70%), myalgia and chills (>40%), arthralgia and fever (>20%).<sup>43,44,45</sup>

#### 4.9. Overdose

Participants who received 58 micrograms of TRADENAME in clinical trials did not report an increase in reactogenicity or adverse events.<sup>18</sup>

In the event of overdose, monitoring of vital functions and possible symptomatic treatment is recommended.

## 5. PHARMACOLOGICAL PROPERTIES

### 5.1. Pharmacodynamic properties

Pharmacological class, therapeutic class

Vaccines

Refer to the current ATC code index for the appropriate code assignment for the pharmacologic and/or therapeutic class.

### Mechanism of action

The nucleoside-modified messenger RNA in TRADENAME is formulated in lipid nanoparticles, which enable delivery of the RNA into host cells to allow expression of the SARS-CoV-2 S antigen. The vaccine elicits both neutralizing antibody and cellular immune responses to the spike (S) antigen, which may contribute to protection against COVID-19.<sup>19,20</sup>

### Efficacy

Study 2 is a multicenter, placebo-controlled efficacy study in participants 12 years of age and older. Randomization was stratified by age: 12 through 15 years of age, 16 through 55 years of age, or 56 years of age and older, with a minimum of 40% of participants in the  $\geq 56$ -year stratum.<sup>12</sup> The study excluded participants who were immunocompromised and those who had previous clinical or microbiological diagnosis of COVID-19.<sup>12</sup> Participants with pre-existing stable disease, defined as disease not requiring significant change in therapy or hospitalization for worsening disease during the 6 weeks before enrollment,<sup>21</sup> were included as were participants with known stable infection with human immunodeficiency virus (HIV), hepatitis C virus (HCV), or hepatitis B virus (HBV).<sup>12</sup>

#### *Efficacy in participants 16 years of age and older*

In the Phase 2/3 portion of Study 2, based on data accrued through 14 November 2020, approximately 44,000 participants 12 years of age and older were randomized equally and received 2 doses of COVID-19 mRNA Vaccine or placebo separated by 21 days. The efficacy analyses included participants that received their second vaccination within 19 to 42 days after their first vaccination. Participants are planned to be followed for up to 24 months, for assessments of safety and efficacy against COVID-19.<sup>12,27</sup>

The population for the analysis of the primary efficacy endpoint included, 36,621 participants 12 years of age and older (18,242 in the COVID-19 mRNA Vaccine group and 18,379 in the placebo group) who did not have evidence of prior infection with SARS-CoV-2 through 7 days after the second dose.<sup>22</sup> Table 3 presents the specific demographic characteristics in the studied population.

- a. All eligible randomized participants who receive all vaccination(s) as randomized within the predefined window, have no other important protocol deviations as determined by the clinician, and have no evidence of SARS-CoV-2 infection prior to 7 days after Dose 2.
- b. Includes multiracial and not reported.
- c. Number of participants who have 1 or more comorbidities that increase the risk of severe COVID-19.
  - Chronic lung disease (e.g., emphysema and chronic bronchitis, idiopathic pulmonary fibrosis, and cystic fibrosis) or moderate to severe asthma
  - Significant cardiac disease (e.g., heart failure, coronary artery disease, congenital heart disease, cardiomyopathies, and pulmonary hypertension)

  - Diabetes (Type 1, Type 2, or gestational)
  - Liver disease
  - Human Immunodeficiency Virus (HIV) infection (not included in the efficacy evaluation)

At the time of the primary efficacy analysis, participants had been followed for symptomatic COVID-19 for at least 2214 person-years for the COVID-19 mRNA Vaccine and at least 2222 person-years in the placebo group.<sup>32</sup>

There were no meaningful clinical differences in overall vaccine efficacy in participants who were at risk of severe COVID-19 including those with 1 or more comorbidities that increase the risk of severe COVID-19 [e.g., asthma, body mass index (BMI)  $\geq 30$  kg/m<sup>2</sup>, chronic pulmonary disease, diabetes mellitus, hypertension].<sup>23,24</sup>

The vaccine efficacy information is presented in Table 4.

- N = number of participants in the specified group.
- n1 = Number of participants meeting the endpoint definition.
- Total surveillance time in 1000 person-years for the given endpoint across all participants within each group at risk for the endpoint. Time period for COVID-19 case accrual is from 7 days after Dose 2 to the end of the surveillance period.
- n2 = Number of participants at risk for the endpoint.

f. At risk is defined as having at least 1 of the Charlson Comorbidity Index (CMI) category or obesity (BMI  $\geq$ 30 kg/m<sup>2</sup>).

g. Obese is defined as BMI  $\geq$ 30 kg/m<sup>2</sup>.

*Efficacy against severe COVID-19*

Secondary efficacy analyses suggested benefit of the COVID-19 mRNA Vaccine in preventing severe COVID-19.

Efficacy against severe COVID-19 (as defined by the study protocol\*) occurring after the first dose was 88.9% (95% CI: 20.1, 99.7) (1 case in COVID-19 mRNA Vaccine group and 9 cases in placebo group), with an estimated vaccine efficacy of 75.0% (95% CI: -152.6, 99.5) (1 case in COVID-19 mRNA Vaccine group and 4 cases in placebo group) against severe COVID-19 occurring at least 7 days after Dose 2.<sup>36</sup>

*\*Severe illness from COVID-19 is defined by the study protocol as confirmed COVID-19 and presence of at least 1 of the following:*

- *Clinical signs at rest indicative of severe systemic illness (respiratory rate  $\geq$ 30 breaths per minute, heart rate  $\geq$ 125 beats per minute, saturation of oxygen  $\leq$ 93% on room air at sea level, or ratio of arterial oxygen partial pressure to fractional inspired oxygen  $<$ 300 mm Hg);*
- *Respiratory failure [defined as needing high-flow oxygen, noninvasive ventilation, mechanical ventilation or extracorporeal membrane oxygenation (ECMO)];*
- *Evidence of shock (systolic blood pressure  $<$ 90 mm Hg, diastolic blood pressure  $<$ 60 mm Hg, or requiring vasopressors);*
- *Significant acute renal, hepatic, or neurologic dysfunction;*
- *Admission to an Intensive Care Unit;*
- *Death.*

Efficacy against severe COVID-19 which is defined (by the Centers for Disease Control and Prevention) as hospitalization, admission to the Intensive Care Unit, intubation or mechanical ventilation, or death occurring after the first dose was 92.9% (95% CI: 53.2, 99.8) (1 case in COVID-19 mRNA Vaccine group and 14 cases in placebo group).<sup>37</sup>

*Efficacy and immunogenicity in adolescents 12 to 15 years of age*

An analysis of Study 2 has been performed in adolescents 12 to 15 years of age up to a data cutoff date of 13 March 2021.

The vaccine efficacy information in adolescents 12 to 15 years of age is presented in Table 7.

Note: Confirmed cases were determined by Reverse Transcription-Polymerase Chain Reaction (RT-PCR) and at least 1 symptom consistent with COVID-19 (symptoms included: fever; new or increased cough; new or increased shortness of breath; chills; new or increased muscle pain; new loss of taste or smell; sore throat; diarrhea; vomiting).

\* Participants who had no evidence of past SARS-CoV-2 infection (i.e., N-binding antibody [serum] negative at Visit 1 and SARS-CoV-2 not detected by NAAT [nasal swab] at Visits 1 and 2), and had negative NAAT (nasal swab) at any unscheduled visit prior to 7 days after Dose 2 were included in the analysis.

- N = Number of participants in the specified group.
- n1 = Number of participants meeting the endpoint definition.
- Total surveillance time in 1000 person-years for the given endpoint across all participants within each group at risk for the endpoint. Time period for COVID-19 case accrual is from 7 days after Dose 2 to the end of the surveillance period.
- n2 = Number of participants at risk for the endpoint.
- Confidence interval (CI) for vaccine efficacy is derived based on the Clopper and Pearson method adjusted for surveillance time.

In Study 2 an analysis of SARS-CoV-2 neutralizing titers in a randomly selected subset of participants was performed to demonstrate non-inferior immune responses (within 1.5-fold) comparing adolescents 12 to 15 years of age to participants 16 to 25 years of age who had no serological or virological evidence of past SARS-CoV-2 infection. The immune response to TRADENAME in adolescents 12 to 15 years of age (n=190) was non-inferior to the immune

response in participants 16 to 25 years of age (n=170), based on results for SARS-CoV-2 neutralizing titers at 1 month after Dose 2. The geometric mean titers (GMT) ratio of the adolescents 12 to 15 years of age group to the participants 16 to 25 years of age group was 1.76, with a 2-sided 95% CI of 1.47 to 2.10, meeting the 1.5-fold non-inferiority criterion (the lower bound of the 2-sided 95% CI for the geometric mean ratio [GMR] >0.67) which indicates a statistically greater response in the adolescents 12 to 15 years of age than that of participants 16 to 25 years of age.<sup>48</sup>

## 5.2. Pharmacokinetic properties

Not applicable.

## 5.3. Preclinical safety data

Non-clinical data reveal no special hazard for humans based on conventional studies of repeat dose toxicity and reproduction and developmental toxicity.<sup>10,11</sup>

Sodium chloride

Disodium hydrogen phosphate dihydrate

Sucrose

Water for injections

### 6.2. Incompatibilities

This medicinal product must not be mixed with other medicinal products except those mentioned in Sections 6.3 and 6.6.

### 6.3. Shelf life

#### Unopened vial

6 months at -90 °C to -60 °C.

Alternatively, unopened vials may be stored and transported at -25 °C to -15 °C for a total of 2 weeks and can be returned to -90 °C to -60 °C.<sup>39</sup>

Once removed from the freezer, the unopened vial can be stored for up to 5 days at 2 °C to 8 °C. Within the 5 days shelf-life at 2 °C to 8 °C, up to 12 hours may be used for transportation.<sup>29</sup> Prior to use, the unopened vial can be stored for up to 2 hours at temperatures up to 30 °C.

**Once thawed, the vaccine should not be re-frozen.**

*Transfers of frozen vials stored at ultra-low temperature (<-60 °C)*

- Closed-lid vial trays containing 195 vials removed from ultra-low temperature frozen storage (<-60 °C) may be at temperatures up to 25 °C for up to 5 minutes.
- Open-lid vial trays, or vial trays containing less than 195 vials, removed from ultra-low temperature frozen storage (<-60 °C) may be at temperatures up to 25 °C for up to 3 minutes.
- After vial trays are returned to frozen storage following temperature exposure up to 25 °C, they must remain in frozen storage for at least 2 hours before they can be removed again.

*Transfers of frozen vials stored at -25 °C to -15 °C<sup>40</sup>*

- Closed-lid vial trays containing 195 vials removed from frozen storage (-25 °C to -15 °C) may be at temperatures up to 25 °C for up to 3 minutes.
- Open-lid vial trays, or vial trays containing less than 195 vials, removed from frozen storage (-25 °C to -15 °C) may be at temperatures up to 25 °C for up to 1 minute.

Once a vial is removed from the vial tray, it should be thawed for use.

Diluted medicinal product

Chemical and physical in-use stability, including during transportation,<sup>30</sup> has been demonstrated for 6 hours at 2 °C to 30 °C after dilution in sodium chloride 9 mg/mL (0.9%) solution for injection. From a microbiological point of view, the product should be used immediately. If not used immediately, in-use storage times and conditions are the responsibility of the user.

**6.4. Special precautions for storage<sup>2,25</sup>**

Store in a freezer at -90 °C to -60 °C.

Store in the original package in order to protect from light.

During storage, minimize exposure to room light, and avoid exposure to direct sunlight and ultraviolet light.

Thawed vials can be handled in room light conditions.

For storage conditions after thawing and dilution of the medicinal product, see Section 6.3.

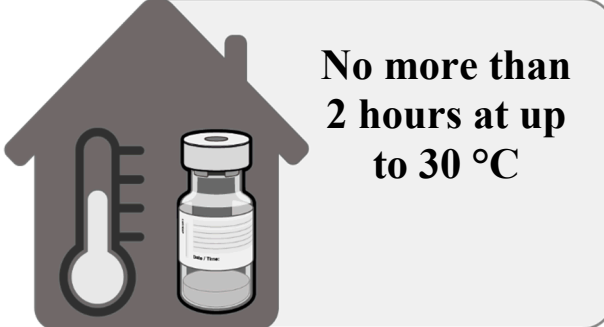

**6.5. Nature and contents of container**

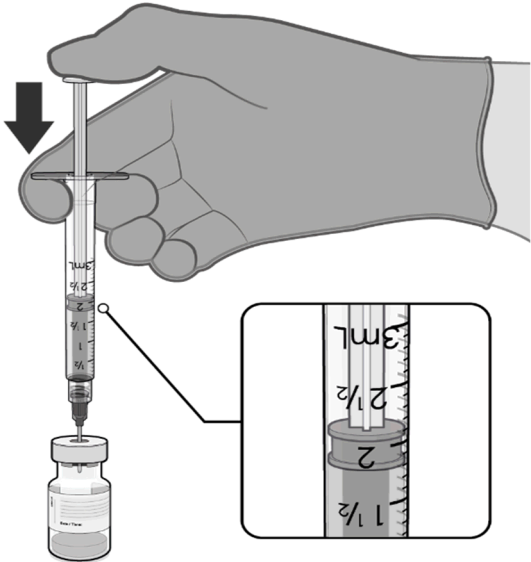

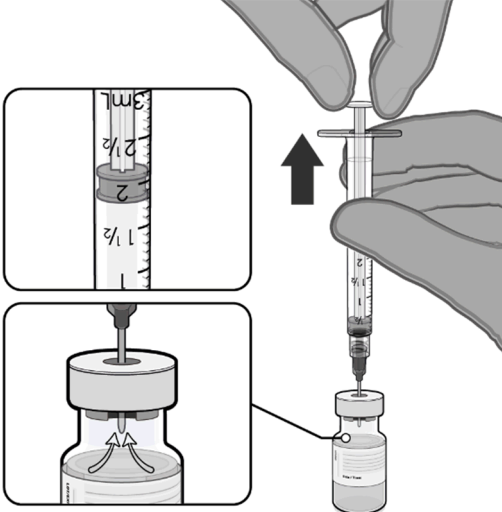

*Information to be provided by local subsidiary.*

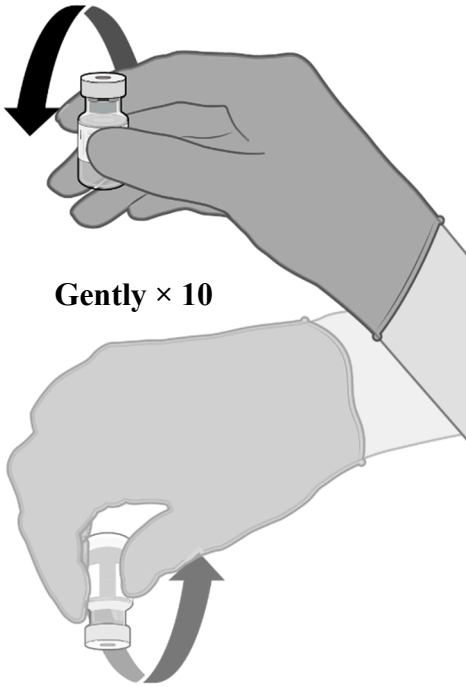

## 6.6. Special precautions for disposal and other handling<sup>2,3,26,29,30,35</sup>

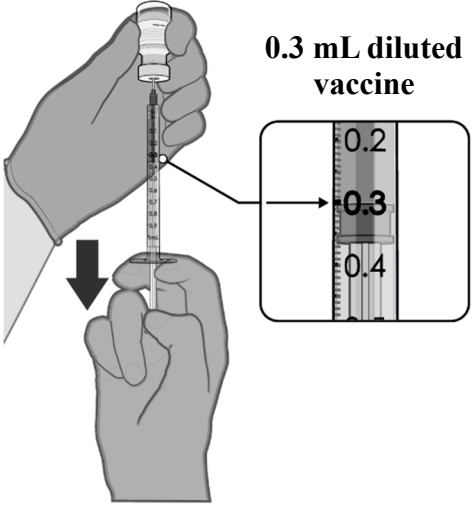

### Handling instructions

TRADENAME should be prepared by a healthcare professional using aseptic technique to ensure the sterility of the prepared dispersion.

THAWING PRIOR TO DILUTION	
 <p><b>No more than 2 hours at up to 30 °C</b></p>	<ul style="list-style-type: none"><li>• The multidose vial is stored frozen and must be thawed prior to dilution. Frozen vials should be transferred to an environment of 2 °C to 8 °C to thaw; a 195 vial pack may take 3 hours to thaw. Alternatively, frozen vials may also be thawed for 30 minutes at temperatures up to 30 °C for immediate use.</li><li>• The unopened vial can be stored for up to 5 days at 2 °C to 8 °C. Within the 5 days shelf-life at 2 °C to 8 °C, up to 12 hours may be used for transportation.</li><li>• Allow the thawed vial to come to room temperature and gently invert it 10 times prior to dilution. Do not shake.</li><li>• Prior to dilution, the thawed dispersion may contain white to off-white opaque amorphous particles.</li></ul>

<b>DILUTION</b>	
 <p><b>1.8 mL of 0.9% sodium chloride injection</b></p>	<ul style="list-style-type: none"><li>• The thawed vaccine must be diluted in its original vial with 1.8 mL sodium chloride 9 mg/mL (0.9%) solution for injection, using a 21 gauge or narrower needle and aseptic techniques.</li></ul>
 <p><b>Pull back plunger to 1.8 mL to remove air from vial.</b></p>	<ul style="list-style-type: none"><li>• Equalize vial pressure before removing the needle from the vial stopper by withdrawing 1.8 mL air into the empty diluent syringe.</li></ul>

 <p><b>Gently × 10</b></p>	<ul style="list-style-type: none"><li>• Gently invert the diluted dispersion 10 times. Do not shake.</li><li>• The diluted vaccine should present as an off-white dispersion with no particulates visible. Do not use the diluted vaccine if particulates or discoloration are present.</li></ul>
 <p><b>Record appropriate date and time. Use within 6 hours after dilution.</b></p>	<ul style="list-style-type: none"><li>• The diluted vials should be marked with the appropriate date and time.</li><li>• After dilution, store at 2 °C to 30 °C and use within 6 hours, including any transportation time.</li><li>• Do not freeze or shake the diluted dispersion. If refrigerated, allow the diluted dispersion to come to room temperature prior to use.</li></ul>

<b>PREPARATION OF INDIVIDUAL 0.3 mL DOSES OF COMIRNATY</b>	
 <p><b>0.3 mL diluted vaccine</b></p>	<ul style="list-style-type: none"><li>• After dilution, the vial contains 2.25 mL from which 6 doses of 0.3 mL can be extracted.</li><li>• Using aseptic technique, cleanse the vial stopper with a single-use antiseptic swab.</li><li>• Withdraw 0.3 mL of TRADENAME.</li></ul> <p>Low dead-volume syringes and/or needles should be used in order to extract 6 doses from a single vial. The low dead-volume syringe and needle combination should have a dead volume of no more than 35 microliters.</p> <p>If standard syringes and needles are used, there may not be sufficient volume to extract a sixth dose from a single vial.</p> <ul style="list-style-type: none"><li>• Each dose must contain 0.3 mL of vaccine.</li><li>• If the amount of vaccine remaining in the vial cannot provide a full dose of 0.3 mL, discard the vial and any excess volume.</li><li>• Discard any unused vaccine within 6 hours after dilution.</li></ul>

Disposal

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.
